C-V2X test solution

The new Keysight C-V2X autonomous drive emulation (ADE) solution enables functional, protocol and radio frequency (RF) measurements on 3GPP Release14 C-V2X devices from the Keysight UXM 5G Wireless Test platform. It supports a range of test types that will support future releases of 5G new radio (NR) C-V2X, to ensure investment protection, including transmitter and receiver testing, protocol testing and application layer testing. Using total scene generation, it exercises advanced driver-assistance systems software using time-synchronised inputs to the actual sensors that enables timely validation of system performance and reduced integration costs.

UWB test solution

Rohde & Schwarz along with Colby Instruments introduce UWB ecosystem, an extremely accurate test solution for angle of arrival and phase difference of arrival characterisation. Engineers testing UWB devices now can combine the R&S CMP200 radio communication tester and WMT software service to implement automated wireless manufacturing testing with the high-precision delay lines XT-200 from Colby Instruments to perform measurements in conducted mode including calibration and verification.

SOFTWARE & EDA TOOLS

Electronic system design simulator

This latest simulation solution includes comprehensive computational fluid

dynamics (CFD) and expanded capabilities in electronic system design (ESD). Updates include all major CFD solutions

under a single licence, expanded end-to-end electronic system design capability, and seamless access to the cloud. This ensures engineering teams always have the most appropriate technology available for each application, reducing modelling and product development times.

C runtime library

The SEGGER emRun runtime library is available as part of the recently announced SiFive 21G1 release. SiFive's focus on toolchain and library support enables key market requirements including reduced code size and lower memory footprints. To support this goal, SiFive has licensed emRun as part of the SiFive Freedom Tools and Freedom-E-SDK packages. This integration enables chip designers to easily achieve optimum performance, while reducing code size by up to 25%. emRun is a complete C runtime library for use with any toolchain. It is used in SEGGER's Embedded Studio IDE and has been designed and written from the ground up for embedded devices to deliver high performance with a small footprint.

MANUFACTURING EQUIPMENT

Solder paste inspection solution

The new 3D high-speed solder paste inspection (SPI) solution TR7007 SII Ultra performs at an industry-leading speed of up to 180cm²/sec and is built on the award-winning TR7007 SII Plus series that has an enhanced mechanical platform to guarantee stability, accuracy, and precision

during inspection. It can accurately inspect low solder bridges and compensate board warpage for eliminating local PCB deformation. The SPI solution eases data exchange between the production line and the MES of your choice to enable data traceability for the connected factory.

Smart vision inspection system

The R-Series is a new range of smart vision systems for automatic inspection and validation of product codes including date codes, batch numbers, barcodes, and 2D-printed codes. The R-Series eliminates the need for

manual code validation and inspection, significantly reducing the risk of an incorrect code leaving a manufacturing site unnoticed, while allowing for more efficient use and distribution of resources.

ENTERPRISE CLASS

Enterprise storage

With the help of user-friendly management software EonOne and EonView, EonStor GS provides high-bandwidth file-level transmission interfaces in the multimedia collaboration environment.

It has rich I/O interface for high-speed network environments including 1GbE, 10GbE, 25GbE, and 40GbE ports. 100GbE can also be supported by connecting 1*100GbE to 4*25GbE transition cable. With the constant evolution of storage platforms, the EonStor GS adopts the EonOne management software to assist customers improve storage and service efficiency to increase productivity. Its intuitive interface design allows for centralised management of multiple systems, monitoring of performance and capacity usage, and completion of all related system configurations.
