

The cockpit HPC can drive multiple displays in the vehicle for driver and passengers. The user will be able to distribute content across multiple displays. For example, using gesture control, driver can drag navigation content from the central display onto driver display, and can also arrange various elements in the display areas they like, thus providing a customised user experience. In autonomous driving mode, the driver can immerse

Besides, the driver receives an intuitive and reliable confirmation for every action initiated. This strengthens the trust in the vehicle's functions and clearly indicates that the driver is and will remain in constant control of the situation. This kind of trust is particularly important when looking at future technologies such as automated driving. Autonomous and connected driving increases the complexity of the mobility world and provides so many

even anticipates the wishes of the driver. A natural dialogue between the driver and the vehicle is realised by using cloud based voice services.

An assistant has been linked to several vehicle functions to support, for example, an interactive user manual that immediately explains to the driver the meaning of warnings or error messages. Depending on the warning and based on the driver's user behaviour, the digital companion offers smart suggestions on how to proceed.

Summing up HMI's role

As we are moving towards smart, connected, and autonomous mobility, the interaction between the vehicle and the human has also evolved. The HMI solutions of today not only enhance the in-vehicle experience and convenience but also deliver personalised experiences. Only the information that is critical at a particular moment is communicated to the driver by these advanced HMI solutions. This minimises the distraction and increases

into the connected entertaining world as the cockpit HPC merges the multi display content into one big screen providing all the services and apps for entertainment.

Holistic HMI enabled future

Holistic human-machine solutions will lay the foundation for autonomous, connected, electric, and shared mobility by providing an end-to-end experience for users, and not be limited to booking a ride and transporting passengers to their destination. The concept also helps the drivers to plan the next course of their journey and provide relevant information about social events. Information is collected, prioritised, and quickly presented in a focused and clear way. The flow of information is reduced by taking the driving situation and the driver's condition into account. Only the relevant information and appropriate actions are offered in the respective situation.

The Ac2ated sound and AMBEO mobility solutions from Continental and Sennheiser create a truly lifelike, immersive 3D sound experience, revolutionising audio technology in the car

features for the user, and these features are made accessible to the user with a simple intuitive holistic HMI.

Following the concept of a holistic HMI, the entire vehicle can be turned into a digital companion using artificial intelligence. Based on deep machine learning algorithms, the digital companion remembers and interprets the user's behaviour, adapts navigation or infotainment offers, and

the safety of a vehicle, and contributes to the industry's shared Vision Zero - Zero Fatalities, Zero Injuries, and Zero Crashes. HMI makes the processing and management of information easy, intuitive, and reliable. **EFY**
