

Electronics Start-ups And India: The Time Is Now

The government has announced schemes that are promising tens of billions of rupees as incentives for manufacturing electronics within India. The big and small companies, as they start operations in the country, will need a lot of support from the local companies, and these support-providing companies will have a lot of opportunities to establish themselves as big names in the world of start-ups

Mukul Yudhveer Singh

Rome was not built in a day! While this idiom might have different meanings for different individuals and institutions, for the electronics start-ups ecosystem in India it might stand for the hard work and dedication required to enable them to become the next big thing.

Let us face the fact that setting up an electronics hardware start-up is a far cry from setting up a software or services start-up. Of course, making any of these start-ups successful

takes a lot of hard and smart work, but when it comes to electronics start-ups, that hard and smart work requires a little more effort than the rest of the lot.

Look at the number of successful start-ups that have originated in India. The contrast between service and software start-ups and the electronics start-ups will be more than enough to testify to what has been said above.

Fortunately, a lot of things have started to change in the country,

which are paving the way for the existing electronics start-ups to become successful and are creating room for new electronics start-ups to emerge. Nitin Kunkolienker, president of the Manufacturers' Association for Information Technology (MAIT), in a recent interaction with *Electronics For You* magazine group, noted that the recently announced production linked incentive (PLI) schemes by the government of India carry the potential to create an ecosystem for electronics
