

Blockchain To The Rescue: Eliminating Fraud In Food Supply Chain

Food fraud is a persistent problem in our globalised food supply chain. Driven by the complexity of today's global food system, food fraud continues to thrive. So, the need to prevent it is becoming increasingly compelling, not only from the standpoint of public health but also from legal and financial concerns

Dr Veerendrakumar
M. Narasalagi

Food fraud costs the global food industry about \$40 billion each year, according to Dr John Spink who is known for his work on anti-counterfeiting and food safety. The food industry could save up to \$31 billion by tracking food on its way from farms to consumers via blockchain. As long as there is profit to be

made (and there is), everything from honey and milk to peanuts and whiskey are at risk of adulteration. Regardless of the level of safety implications or where the vulnerability occurred, suppliers are largely liable for the impact—but every stakeholder in the food supply chain suffers.

Unscrupulous suppliers sometimes
