MANUFACTURING EQUIPMENT

Metal 3D printers

The iFusion LF series is a new metal 3D printer built for cost-effective manufacturing, aiming to deliver robustness and productivity at a competitive MHR (man hours required) and lowest cost-per-part (CPP). It has a range that starts with a single 500W laser printer and is upgradeable to a quad laser configuration with 700W and 1000W lasers.

Deep learning platform

The DLAP x86 series is a compact GPU-enabled deep learning acceleration platform, which targets the deployment of deep learning at the edge where data is generated and actions are taken. It is optimised to deliver AI performance in various industrial applications involving manufacturing by accelerating compute-intensive, memory-hungry AI inferencing and learning tasks.

CHEMICALS & ADHESIVES

Resins for EV batteries

New resin solutions for EV customers have been developed that solve heat, performance, and protection issues. The SC4003 is a thixotropic two-part silicone potting and encapsulating resin that secures a battery at the base and ensures effective heat dissipation. The GF400 is a highly effective heat transfer solution, providing excellent

thermal performance. The ER2221, a highly thermally conductive resin with low viscosity, helps achieve prolonged battery life and high efficiency, making it ideal for potting cells within electric vehicle batteries.

Flux-cored wire

The CW-232 is a highly activated rosin flux-cored wire that meets the demanding requirements of robotic and laser soldering applications by delivering additional wetting power to achieve higher throughput. The wire works well for in-hand soldering applications as well. Due to its 'no-spatter' technology, CW-232 eliminates flux spattering that can cause burn injuries or impair the vision system of the robotic soldering machines.

EDA TOOLS

PCB designing software

Offering significant speed improvements in PCB designing is the new Pulsonix 11.0. The underlying graphics engine has been reconfigured by utilising DirectX graphics and high-performance graphics cards such as those used in the gaming industry. Additionally, multi-threading capabilities increase speed by utilising parallel processing. Besides the speed advantage, new graphics enhances rendering quality of the design image being viewed.

ENTERPRISE-CLASS PRODUCTS

Industrial PC

The ISR301 ruggedised compact computing system, built for both industrial and commercial applications, is powered

by a quad-core NXP Cortex A53 i.MX 8M processor in 1.3GHz frequency. The i.MX 8M processor offers unprecedented

media processing capabilities, allowing the ISR301 to deliver 4K immersive multimedia content. An industrial-grade design ensures a 24/7 operation in a wide operating temperature range between -10°C and 60°C.

trial-grade design ensures a 24/7 operation in a wide operating temperature range between -10°C and 60°C.

Multifunctional ID card

Claiming to be the world's first solution, the Campeon Card is a smart card that combines highly-secured office building access with contactless payment functionality. It allows employees to enter company buildings and the workplace, make cashless payments, or transmit their digital business card using NFC, complying with the EMV standard used internationally. At the heart of the multifunctional ID card is the SECORA Pay solution, which allows quick and efficient certified payment. The CIPURSE functionality integrated into the chip allows secure access to company buildings.

Automated power panel

The new power panel C80 offers combined advantages of a powerful controller and a modern operator terminal in a single HMI device. With its low installation depth, the C80 multi-touch HMI is suitable for particularly compact machines where space in the control cabinet is limited. Operation without a hard disk and fan also makes it particularly low-maintenance panel. The power panel C80 can be put into operation quickly and easily because all the necessary software packages are pre-installed.
