

components. Having a dimension of 5mm × 5mm × 0.75mm, the EP7038 is a small IVR that features a fast transient response without requiring any external capacitors for 500ns full-load step. Applications include optical transceiver modules, networking and communication SoCs, AI/ML processors, and FPGA systems.

Radar based smart entrance counter for public places

Social distancing has become an essential precautionary measure to slow down the spread of Covid-19 amongst the general public. Taking heed of this, Infineon

Technologies has developed a solution that counts the number of people entering and leaving buildings or rooms to ensure proper social distancing. The smart entrance counter is a small, discrete radar board (20mm × 15mm) that can accurately and anonymously count the number of people with a single 60GHz radar sensor and integrated software. It prevents overcrowding and enables businesses to keep their operations running. And, most importantly, due to the use of radar technology personal data is hundred percent protected.

Second-gen wireless temperature sensor

The wireless temperature sensor from Disruptive Technologies measures the surrounding temperature and transmits the data to a nearby cloud connector (Gateway) via SecureDataShot technology. The cloud connector relays temperature readings to Disruptive Technologies' cloud service at fixed intervals. The sensor has three distinct software configurable modes for sampling, logging, and triggering. With the

new logging mode, the temperature sensor will be able to deliver more than 30x the number of data points within a

15-minute heartbeat, making it perfect for applications with rapid temperature changes or machine learning applications where higher resolution datasets are necessary.

Image sensor with quadrupled resolution and small size

The tiny new OH0TAOVMed medical image sensor from OmniVision Technologies quadruples the RGB image resolution to 400 × 400, or 160k pixels, at 30

frames per second, while reducing the power consumption by 20 percent to 20mW. This gives

medical device OEMs the flexibility to create a larger-diameter scope with a larger working channel and increased resolution for detailed higher quality colour images required for procedures such as neuro, ophthalmic, ENT, cardiac, spinal, urology, gynaecology, and arthroscopy. Additionally, the sensor's lower power consumption reduces 'chip on tip' camera heat for greater patient comfort and longer procedure durations, while also reducing noise for crisper images.

Latest solution for at-a-distance wireless charging

Energous Corporation has developed an evaluation board that combines e-peas'

power management IC technology and Energous' radio frequency solution to support at-a-distance wireless charging applications for smart buildings,

industrial IoT sensors, retail electronic displays, and more. The evaluation board functionality is expected to include DA2210 WPT rectifier, AEM30940 harvesting PMIC,

supercap or rechargeable lithium battery support, Smartbond DA14531 based BLE SoC, and more. Energous' WattUp wireless charging technology is based on radio frequency, which provides many benefits for wireless charging including the ability to be designed into small form factor products and devices without flat surfaces.

Cloud service for accurate location of indoor and outdoor moving items

Alps Alpine has now developed MonoTra, a cloud service that enables accurate location of both indoor and outdoor moving items that are not always in a reliable communication environment. Deployment of the service improves the accuracy of the company's long-lifetime

asset tracker location data and simplifies system development and operation. A long-lifetime asset tracker determines the location of a logistics asset using the MAC addresses of Wi-Fi access points. MonoTra improves the accuracy of location information using a Skyhook precision location solution, with access to Skyhook data on more than 5.4 billion Wi-Fi access points worldwide. Customers also receive a private database for registering their own Wi-Fi access point position information, allowing even greater accuracy improvements.
