

of applications within the industrial, vision, healthcare, broadcast, consumer, automotive, and networking markets. They deliver high-com-

pute density, performance-per-watt, and scalability in compact packaging options. Both Artix and Zynq UltraScale+ families include RSA-4096 authentication, AES-CGM decryption, DPA countermeasures, and Xilinx's proprietary Security Monitor IP that adapts to security threats across the product life cycle.

Switching PWM audio amplifier

The HFDA801A is a 2MHz switching pulse-width modulation (PWM) Class-D amplifier with a quad-bridge configura-

tion that is specifically designed for compact, cost-effective automotive applications.

An integrated high-performance DAC ensures hi-fi quality sound under any load condition. With signal-to-noise ratio of 121dB, 120dB dynamic range, and only 10µV output noise, the HFDA801A delivers an extraordinary level of audio performance from an inexpensive small form-factor.

RF timers for 4G/5G radio

Three new low phase noise, high-frequency RF timing solutions for 4G and 5G radio, 8V19N850 radio synchroniser and 8V19N880 and 8V19N882 JESD204B/C clock jitter attenuators, deliver ITU-T compliant network clock synchronisation, best-in-class phase noise, and high clock frequency, addressing the need for full signal chain solutions. The 8V19N850 is equipped

with features for radio synchronisation on a single chip. The 8V19N880 and 8V19N882 deliver low phase noise and exceptional jitter performance as low as 74fs RMS

and -90dB spurious attenuation for mission-critical industrial data converter applications in wireless radio, test & measurement, instrumentation, and high-performance imaging.

MODULES & BOARDS

Wi-Fi 4 and Bluetooth 5 modules

Based on NXP's IW416 chip, the MAYA-W1 series is tailored to a wide range of fast-growing, future-oriented applications such as power management, electric vehicle charging,

professional appliances, tracking, telematics, and fleet management.

Robust, flexible, and reliable, it offers product designers short-range connectivity that is both cost-effective and simple to implement. Qualified for operation up to 85°C and fitting on a 10mmx14mm footprint, the device is ideal for size-constrained applications that operate in harsh industrial environments.

Synchronous DC-DC converters

The MAX17577 and MAX17578 are small, highly-efficient 60V synchronous inverting DC-DC step-down converters with integrated level shifters. These devices

save up to 72% of board space by reducing component count by half while using 35% less energy. Both ICs reduce

size, heat, and cost, while simplifying the design of negative output voltage rails needed for analogue signals within intelligent IoT devices found in factory automation, building automation, and communications systems.

SMARC module for edge AI

The LEC-IMX8MP SMARC (smart mobility architecture) module uses NXP's next-generation i.MX 8M Plus SoC for edge AI applications across

industrial AIoT/IoT, smart homes, smart cities, and beyond. The powerful quad-core Arm Cortex-A53

processor runs up to 1.8GHz with an integrated neural processing unit, delivering up to 2.3 TOPS, suited for applications that require machine learning and vision systems paired with smart sensors to enable industrial decision-making.

Point of load regulators

The PNA series, analogue non-isolated point of load regulators in compact size, offers excellent efficiency and thermal

performance. Its wide input voltage range of 9V to 36V and high efficiency of 95.5% make it

ideal for a range of industrial applications including robotics, factory automation, and process control, for both 12V and 24V power systems. It also reduces power losses and provides good thermal performance.
