

Autopilot Applications For Autonomous Vehicles

The article describes how various autopilot applications have evolved and are now helping in making autonomous vehicles that are safe enough to be driven even by the physically challenged and visually impaired people

Autonomous vehicles are termed as the ultimate solution for future automotive engineering as these will revolutionise the transportation industry like no other change since the invention of the automobile. For the past hundred years, innovation in automotive sector has created safer, cleaner, and more affordable vehicles, but the progress has been incremental. The industry is now having paradigm shift towards auto-

mous, self-driving technology. This technology has potential to provide extreme benefits to society in terms of safety on road, no accidents, no congestion, no pollution and, above all, safety and benefits to the disabled persons in the society.

Autonomous vehicle is moving a manual driving vehicle to self-driving using various sensors and actuators that take decision on driving based on various parameters. An autonomous vehicle is
