

Is It E-Waste Or Gold, Silver, And Platinum Waste?

As only 17.4 percent of e-waste was collected and recycled in 2019, it resulted in a loss of nearly \$47 billion in recoverable materials including gold, silver, platinum, and other high-value materials

Mukul Yudhveer Singh

If it was not for evaporation, humans would have suffered from lack of potable water. Nature, as a matter of fact, knows the importance of a circular economy better than us humans. Ranging from metals to water to crude oil, it tries to replenish any and everything we use. But have we been able to understand how critical circular economy is?

A circular economy, in simple words, can be explained as a systemic approach to

economic development designed to benefit businesses, society, and the environment. In contrast to the 'take-make-waste' linear model, a circular economy is regenerative by design and aims to gradually decouple growth from the consumption of finite resources.

"The biggest benefit of recycling is that you will not have to do so much mining. You are essentially offsetting the impact of mining on nature by enabling a circular economy
