

employs novel current limit architecture and line phase detection while incorporating control algorithms to deliver

a cost-effective solution without compromising on performance. At the heart of this IC is an internally compensated digital loop control. The

device employs a constant on-time CrM architecture with valley switching. High efficiency at light load can also be met due to in-built discontinuous conduction mode with valley synchronised turn-on during frequency fold back operation.

IC for IoT applications

The Essential Analog MAX16162 allows designers to enhance system reliability in low-voltage IoT applications. It eliminates

glitches until the input voltage achieves the appropriate voltage threshold. Eliminating

glitches improves reliability not only for IoT systems but also portable medical monitoring devices, wearables, base stations, programmable logic controllers, and automation controls. MAX16162 draws only 825nA.

MODULES & BOARDS

Indoor positioning kits

Designed for low power consumption, simple deployment, and low cost of ownership, the XPLR-AOA-1 and XPLR-AOA-2 explorer kits make it easy to

test the technology's capabilities to enable a

variety of applications including access control, collision detection, smart appliances, indoor positioning, and asset tracking. They showcase

complete Bluetooth based tracking solutions that reliably offer sub-metre-level accuracy in indoor environments.

CompactPCI serial processor

The cPCI-A3525 series CompactPCI serial processor blade in single-slot (4HP) form factor features the latest 9th generation Intel Xeon/Core i7 proces-

sor, formerly known as Coffee Lake Refresh. It supports the newer CompactPCI serial standard, PICMG CPCI-S.0, for next-generation, mission-critical applications requiring higher performance such as railway transportation, aerospace and defence, and industrial automation.

Development kit

The new EV12AQ600-FMC-EVM development kit is an invaluable tool for implementing mixed-signal subsystems.

Intended for prototyping work relating to avionics, military, space, telecommunications,

industrial, and high energy physics applications, it may be used for evaluating the operation of the company's EV12AQ600 and EV12AQ605 12-bit quad-channel ADCs, meaning engineers can quickly construct functioning prototypes and check the expected operational parameters.

System on Module

The miriac MPX-S32G274A SoM comes with quad Arm Cortex-A53 cores plus triple Arm Cortex-M7 dual cores and combines ASIL D safety and hardware

security with more than 10 times the real-time performance and networking throughput of NXP's previous automotive gateway devices. The SoM

offers multiple native CAN interfaces as well as comprehensive FlexRay, LIN, and Ethernet support. Target

markets are real-time connected vehicles, mobile machinery, and automotive test and measurement equipment.

MicroSys Electronics

DC-DC converter

The BMR482 is a 2nd generation direct conversion isolated DC-DC converter. By converting directly from a 48V supply

to the load voltage, without an intermediate stage, the BMR482 delivers increased efficiency in a compact

package, enabling it to meet the higher power needs of today's data centres and cloud computing. The device can achieve up to 91.3% efficiency with a 0.8V output at 53Vin and requires 50% less board space than other 2-stage solutions.

Flex Power Modules

www.flexpowermodules.com

600W power supply

The 600-watt AEA600F power supply series delivers 300% peak power for up to 1,000 milliseconds. Designed for

applications requiring a high level of safety, it is suitable for industrial and

medical applications. Optimised for free-air convection, it is ideal for use in equipment operated in low noise environments. For low harmonic current distortion, the AEA600F uses active power factor corrector, and the switch-
