

The Science Of Fundraising For Electronics Startups

Finding the right investors that genuinely see the value of your startup is an absolute halo moment. It is like finding the right pair of shoes. It may take time, but the effort is absolutely worth it. We try to make the process a little easier for you by breaking down the investor's psychology, which investors to look at, and how you can shine in the eyes of an investor

Siddha Dhar

Anybody who has ever tried the bare minimum will know that raising funds is possibly one of the most painstaking aspects of building a startup. Founders become nothing short of salesmen going door-to-door (in this case, investor-to-investor) to convince them to invest in them. The bottom line is: Fundraising is HARD!

Raising funds as an electronics startup is even more cumbersome than it would be,

say, for an IT startup, or a software startup. And no matter how exasperating it is, it is something that has to be done. But how?

“Your channels need to be overly broad. You will end up having a lot of conversations with a lot of investors with only one or two clicking at the end. Statistics say that startups need to engage in 98 to 100 conversations with investors before even one of them can materialise into something,” says Rohan Choukkar, VP, Bharat Fund.
