

Automotive Industry's New Dawn Beginning With Two-Wheelers

Projections for electric two-wheelers are estimated to rise consistently, grabbing about 20 percent of the total market by 2026. By 2030, this number is expected to go as high as 60 to 70 percent

Siddha Dhar

India has done well in the automotive industry. Among the many industries upon which the country has laid hands on, it has noted the most growth in the automotive space, producing many domestic companies that have gone on to become global players. But the recent climate concerns have made it clearer than ever that it is time to switch to cleaner, greener means of living. This has brought about the era of the electric car.

The rise of the automotive industry heralded a new era of mobility in the early 20th century. The 21st century demands another such evolution, which can be very

well brought about by electric vehicles (EVs) to reduce, if not undo, the climatic horrors combustibles have caused.

Disruption in the automotive industry is going to be inevitable. And once it begins, it is going to be extremely rapid.

EV taking over ICE

EVs score over internal combustion engine (ICE) vehicles by numerous points, whether it is the experience, life, or power of the vehicle. Not only are they more technologically advanced they require remarkably fewer moving parts and so have much less wear-and-tear.
