SOFTWARE

Safety solution for semiconductors

The Cadence Safety Solution is a new offering that targets safety-critical applications and features integrated analogue

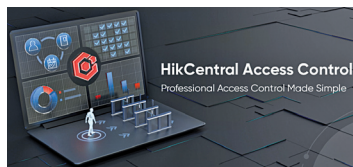

and digital safety flows and engines for faster ISO 26262 and IEC 61508 certification. The solution, which includes new failure modes, effects, and diagnostic analysis (FMEDA) offering called the Cadence Midas Safety Platform, allows customers to perform FMEDA-driven analogue and digital verification of safety-critical semiconductors for advanced automotive, industrial, and aerospace applications. It consists of existing verification, design, analogue and digital tools including the Cadence Jasper Functional Safety Verification (FSV) app, Legato Reliability Solution, Spectre Simulation Platform, and more.

Access and attendance management

The HikCentral Access Control software provides complete access control and attendance capabilities. It is designed

and dedicated for professional access control and time attendance management in an easier and more efficient way. This simplifies security and operations for small and medium businesses, who can integrate the system with their

Hikvision access control and intercom products quickly and easily.

Faster Flash programmer

This enhanced version of XJFlash is an ultra-fast in-system Flash programmer that uses the JTAG interface to connect

to the target board. The software already provides rapid erase and programming, but by adding compression to its data transfer algorithm the verify times are now also shorter; 256Mb can now be verified in 5.4 seconds, depending on the circuit. Combining this with its rapid erase and program cycles makes XJFlash significantly faster than other programmers. XJFlash can be used for Xilinx Zynq UltraScale+ and Zynq-7000 SPI Flash programming as well as with a wide range of FPGAs from Intel/Altera, Lattice, and Microsemi/Actel.

MANUFACTURING EQUIPMENT

PCB inspection system

The new PCB inspection system, the VT-S10 series, features an industry-first imaging technique and AI to best automate the high-precision inspection process

for electronic assemblies while maximising performance and minimising skill-level requirements. The new VT-S10 series 3D AOI was designed with Omron's 5-Zero philosophy in mind. This unique, AI-driven initiative represents a development roadmap that ensures solutions that are more intelligent, integrated, and interactive while driving to meet the real-world goals of a modern, smart factory. By controlling everything from AI image acquisition to model creation and testing, it provides

end-to-end support for all concerns related to production floor needs.

Industrial manufacturing system

The io300 continuous laser assisted deposition printer can process most

industrial materials at high resolution and industrial productivity. For the first time, manufacturers can use their standard cer-

tified industrial materials, control the deposition of each single drop, and reach unmatched production yields. The technology's speed and resolution enable the delivery of commercial solutions across multiple industries. It holds great potential for digital mass-manufacturing applications such as semiconductor packaging and advanced printed circuit board production and assembly.

ENTERPRISE CLASS

Small form-factor computers

The ML100G-53 and ML100G-41 are powered by embedded processing

platforms from Intel and AMD. The new devices are built on highly-reliable, passively cooled

computers for industrial, IoT, and edge computing applications. Dual-core options in the ML100G-53 include the Intel Celeron 6305E or Core i3-1115G4 processors. Quad-core offerings feature the i5-1135G7 or i7-1165G7 processors (all formerly known as Tiger Lake). The ML100G-41 is powered by AMD Ryzen 4000 series CPUs, offering high performance for both graphics-intensive applications and multitasking workloads.
