

on the NXP i.MX 8M Plus application processor. This next generation processor platform is the perfect upgrade for all NXP i.MX 6 based Qseven applications. It brings modern machine learning and AI capabilities as well as TSN support for real-time Ethernet to those applications and will extend their life by an additional 10 to 15 years, maximising the return on investment for such systems. Vertical markets for these low-power modules range from industrial controls, smart robotics, and factory automation to medical health care and retail, and from transportation and smart farming to smart cities and smart buildings.

Low-power asset tag

onsemi has unveiled a new system solution that overcomes the main challenges associated with battery life for asset tracking tag adoption, particularly within industrial sectors where reducing maintenance

efforts and associated costs are a primary concern. The RSL10 asset tag offers battery life of up to five years, which is an increase from the existing one year or a few months. The device consists of low-power consumption RSL10 Bluetooth 5 radio SoC and enhancements at the firmware level. Alongside the RSL10, the platform features a 3-axis accelerometer and environmental sensors (motion, pressure, and temperature) to provide valuable data and insights into an asset's environment, condition, and orientation.

T&M SOLUTIONS

Phase noise analyser and VCO tester

Rohde & Schwarz has launched the new R&S FSPN phase noise analyser and VCO tester for production and design engineers who characterise sources

such as synthesisers, VCOs, OCXOs, and DROs. Providing very high sensitivity and measurement speed, the R&S FSPN is ideal for demanding phase noise and

VCO analysis in development and production. The R&S FSPN can cover frequency ranges from 1MHz to 8GHz and from 1MHz to 26.5GHz, addressing radar and satellite applications in the C band, X band, Ku band, and the complete K band. It is also equipped with three ultra-low-noise DC sources to supply and sweep VCOs.

RF PHY test solution

LitePoint has released the IQxel-MX test system, which handles the high-performance requirements of the new

Wi-Fi 7, IEEE 802.11be standard. The IQxel-MX is a fully integrated RF PHY test solution with signal generation and analysis combined in a single tester, supporting a continuous frequency range from 400MHz to 7.3GHz. It has an analysis bandwidth of 320MHz and best-in-class residual error vector magnitude floor. The system addresses the requirements of the IEEE 802.11be (Wi-Fi 7), 802.11ax (Wi-Fi 6, Wi-Fi 6E), and IEEE 802.11 legacy specifications, as well as a full range of connectivity standards (Bluetooth 5.x, Zigbee, Z-Wave).

USB test solution

Teledyne LeCroy has announced availability of the Voyager M4x USB 3.2 Analyzer (Gen 2x2 20Gb/s), upgrade to USB

3.2 Analyzer/Exerciser (Gen 2x2 20Gb/s) option, a SuperSpeed USB 20Gb/s capable exerciser that enables end-to-end testing for 20Gb/s systems and devices. This new

USB exerciser option allows design and test engineers to mimic real-world USB device behaviours to verify functionality, error recovery, and compliance to the specifications. This supports test interoperability and error recovery, USB SuperSpeed Link Layer compliance specification at 10Gb/s and 20Gb/s rates, and validation of USB Type-C compliance.

SOFTWARE

Software development kit

Renesas has unveiled the R-Car Software Development Kit (SDK), a complete software platform in a single package that enables quicker and easier software development and validation

for smart camera and automated driving applications used in passenger, commercial, and off-road vehicles. The new R-Car SDK is built for rule based automotive computer vision and AI based functions. The simulation platform offers both AI and conventional hardware accelerators for highly accurate simulations in real time. The new R-Car SDK also includes a full set of software samples, popular CNN networks, workshop and application notes, which makes it easier for beginners to enable quick development.

IoT security assessment software

Keysight Technologies has delivered a new Internet of Things (IoT) security assessment software solution that enables IoT chip and device manufacturers,

as well as organisations deploying IoT devices, to perform comprehensive, automated cybersecurity assessments. The software offers comprehensive, automated testing to rapidly cover a large matrix of known and unknown vulnerabilities. IoT security assessments include novel cybersecurity attack tools
