

IoT Startups: India's Ticket To Global Tech Dominance

India has been the torchbearer for a plethora of disruptions that rattled the world, be it the automotive revolution or the software era. With the rising popularity of IoT, will Indian startups be able to emerge as champions of the connected new world too?

Siddha Dhar

IoT typically means an interplay of hardware, software, and telecommunications. Given the huge pool of capital and talent in the country, it does give us an edge to create a seamless integration between the physical world and the virtual world. Indeed, this is a huge opportunity for India as it straddles two distinguished initiatives of the government of India—Atmanirbhar Bharat and Digital India. What could only be termed as a revolutionary paradigm shift in the way things are done, there is an inexhaustive number of use cases that can be built and are yet to be figured out.

“Looking at the size of India’s population and the kind of data points which can be generated only in India, India is destined

to become a hotspot for IoT,” says Manish Porwal, Founding Team Member & Business Head, LogiNext.

The opportunities

IoT is at its infancy in India, the same stage where the IT world was in the early 2000s. Just like any nascent technology, the opportunities to grow in the field are ripe and plentiful.

Every 100 kilometres or so, the complexity of the challenges in the Indian market changes along with consumer behaviour changes, and the need for differentiated services becomes more prominent. But this also provides an opportunity for startups to test a range of permutations and combinations and figure out what solution fits which consumer the best.
