

Electronic Circuits Have To Be Designed – Not Assembled

Now-a-days, designers tend to use off-the-shelf designs and software available on the Internet or from the vendors to design products requisitioned by their clients. While this may be unavoidable in certain circumstances, their rampant use without understanding the factors involved can land them in problem. Here are some important suggestions from a person who has seen it all for such designers

S.A. Srinivasa Moorthy

In the last decade experienced designers have become a rarity and the next generation of engineers does not seem to have the ability or desire to design electronics circuits bottoms up. Most of the designers tend to take an existing circuits or reference (canned) designs that are

provided by the chip vendors to develop their products. Or, worst, they source from the Internet. This practice later leads to trouble when the product (circuit) is being tested. Unknown problems crop up and engineers struggle to identify them. Under these circumstances projects get delayed
