

Cut Through the Noise

Quick and Reliable Sensor Interfaces in Harsh Environments

The ATtiny1627 Family of microcontrollers (MCUs) comes with a 12-bit true differential ADC with Programmable Gain Amplifier (PGA) enabling measurement of small amplitude signals, reclaiming signals from noisy environments, and fast conversion of signals for real-time applications. The ATtiny1627 Family is drop-in compatible with the tinyAVR® 1 and 0 MCU families and migration between them is a breeze.

The ATtiny1627 Family is a perfect fit for sensor nodes, as well as small and efficient control applications. With up to two USARTs, you can easily set-up to communication with different interfaces. Sensor node applications can include Passive Infrared (PIR) motion detectors, measuring thermocouples, measuring low resistance current, measuring of shunt and magnetic encoder. The second USART included in the ATtiny1627 Family enables it to communicate with several interfaces within the application.

Key Features

- Fast and accurate signal measurement with 12-bit differential Analog-to-Digital Converter (ADC)
- Measure small amplitude signals using the PGA
- Improve noise suppression with built-in hardware accumulation and oversampling of up to 1024 samples
