

through 125GHz, thus significantly improving the device models for dramatic improvements in first-time yields and performance. With the additional 5GHz guaranteed frequency sweep, the VNA series meets the market need for accurate verification of components and broadband applications operating at 122GHz.

MANUFACTURING EQUIPMENT

Piezoelectric jetting system

Nordson EFD, a Nordson company, introduces the PICO XP piezoelectric jetting system designed to maintain precise, repeatable non-contact fluid dispensing valve-to-valve, after maintenance

and regardless of external factors such as temperature changes. The system includes a PICO Pulse XP jet valve and PICO Touch XP controller with an intuitive touchscreen interface for simplified setup. It can apply micro-deposits as small as 0.5nL at speeds up to 1,000Hz (deposits per second) continuously.

Updated safety software

B&R now makes it easier than ever to implement safety communication between machines and machine modules. An update to its mapp Safety software now enables programmable

safety functions to be used across complex manufacturing systems with virtually no additional effort—greatly reducing the time spent implementing system wide safety functions. New system components can be added at any time without having to rewrite the safety application. To put a new component into operation, all the operator needs to do is adjust a few parameters on the HMI screen.

ENTERPRISE CLASS

Servers with flexible rackmount

Avalue Technology's high-performance rackmount servers, HPS-246U4A and HPS-621D4A, are now available as L6 barebone or L10 full systems, designed for wide ranging applications including AI, 5G, IoT hub, machine learning, edge computing, and medical precision computing.

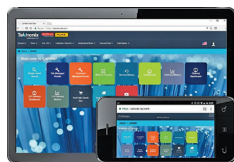

The rackmount server is an industrial standard. With a tool-free cover it can have quick and easy maintenance, and the case-open detection sensor can alert to prevent unauthorised opening. It serves as a building block for all compute-intensive applications and is convertible to be a tower workstation with chassis stands installed. The tower server chassis offers more space with future upgrade potential, better machine scalability, and a wider range of applications.

SOFTWARE & EDA TOOLS

Asset management software

Managing large fleets of test and measurement (T&M) equipment for calibration services can be a time-consuming, manual process.

To address this, Tektronix has upgraded their cloud based asset management software tool called CalWeb. Now T&M engineers can speed up and simplify calibration of their fleet of T&M equipment with the CalWeb 2021. Besides storing securely a customer's calibration, repair history, and related documentation, and enabling access from any computer or mobile device, other features include integration with a customer's in-house IT system, generation of flexible scheduled reports, automation notifications relating to equipment calibration, and creation of barcodes to tag equipment and correlate it to chosen database.

Cloud-connected lab

Renesas Electronics has enhanced its cloud-connected lab with new advanced GUI features and new design parameters that create a more engaging and ergonomic user experience and offer

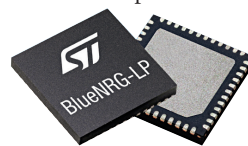

designers greater configuration flexibility. All this will help in simplifying the configuration and testing process along with speeding the time to market. The Lab on the Cloud's new user-friendly GUI introduces new parameters for control and additional results for monitoring. The ergonomic lab layout, advanced features, and intuitive user interface make it easier for users to quickly navigate the environment. Advanced implementations in test setups and control for voice recognition, mobile application and power supply enable complex testing such as transient performance in just a few clicks of the mouse.

IDE for SoC

STMicroelectronics' WiSE Studio, a free-of-charge Integrated Development Environment (IDE) dedicated to the BlueNRG system-on-chip (SoC) product family, features a user-friendly and customisable development environment. With

an extensive list of ready-to-build examples, the new IDE helps both expert and inexperienced users jumpstart their projects by allowing them to learn, explore, and build applications and prototypes with the powerful Bluetooth LE 5.2 features available in devices such as ST's flagship BlueNRG-LP SoC. This includes 2Mbps on-air for faster data transfer, long-range communication, multiple concurrent connections, and mesh networking.
