

Five R's For The Future Of Mobility: Reimagine, Refocus, Reskill, Rebuild, Reuse

The EV sector in India is seeing massive investments rolling in, given the surge in demand for it.

Here's how we can prepare for the disruption in the automotive sector, and tap into opportunities created in the post Covid-19 era

The mobility sector in India as well as abroad is witnessing a major change. The change in consumer choices along with the global pandemic has made the players in the sector innovate to survive. The technologies that are crucial to this change are electric vehicles, autonomous vehicles, and the connected vehicles.

As per a report by India Energy Storage Alliance (IESA), in the base case scenario, EV market is expected to grow at a CAGR of 44% between 2020 and 2027 and hit 6.34 million unit annual sales by 2027.

Reskilling has become mandatory even for experienced professionals in order to survive the changes in the mobility sector. A mobility engineer has to be well equipped with skills in mechanical, electronics, and computer science to progress in this profession.

One should take this as a creative break time to introspect about the way we need go about doing things and prepare ourselves for the post Covid world. The question to ask is, how do we imagine sustainable mobility for the future?

If we are keen to create sustainable mobility for the future, we need to entirely reimagine what the building blocks are, and how we are going to bring them together to build the mobility of the future.

New skills, new jobs

It is just not the technological disruptions alone that we need to reimagine mobility for the future, it is a combination of technology and business model disruptions. It is this combination that brings tremendous power and greatly accelerates the changes that are happening around us. The three technology
