

Truly Innovative **TECH**

Amongst numerous press releases of new products received by us, these are the ones we found worthy of the title *Truly Innovative Tech*

Improved lidar for autonomous vehicles

Innoviz Technologies, a provider of high-performance solid-state lidar sensors and perception software, has unveiled the InnovizTwo Lidar sensor. The new design achieves a 30x performance

improvement over InnovizOne in addition to a 70% cost reduction, which will allow its adoption for any type of vehicle. There is also an extended field of view, increased resolution, and multiple advances in the optical packaging and the electric design. InnovizTwo Lidar sensor is specifically designed for automakers and Robotaxi, shuttle, and delivery companies requiring an automotive-grade, mass-producible solution.

Kinetic module for radio based toggle switches

EnOcean, a producer of energy harvesting technology solutions, has added

PTM 202, a new switch module that is explicitly designed to enable wireless toggle switch devices. Like the PTM 21x family, the new PTM 202 module works battery-free, gaining its energy from the

pressing of a button. It is built in the established original PTM form factor, which makes it compatible with a wide range of single rocker switch designs. Common applications for the PTM 202 modules are toggle switches, central on/off switches as well as switch/actor bundles for retrofitting existing buildings.

Electronic beam steering lidar for automotive and IoT applications

Quanergy Systems, a provider of optical phased array (OPA) based solid-state lidar sensors and smart 3D solutions for automotive and IoT, has demonstrated

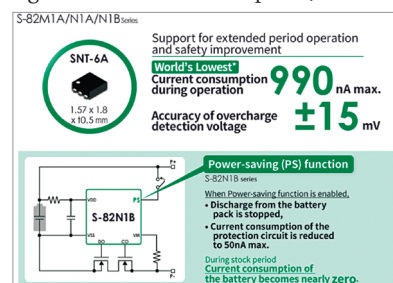

its S3 series lidar, a true solid-state lidar sensor using an industry-first OPA technology and a scalable CMOS silicon manufacturing process for cost-effective, mass-market production. The S3 series lidar sensor is designed to meet the most stringent automotive requirements for object detection and collision avoidance. Its unique electronic beam steering without any moving parts offers immunity to shock and vibration while providing over 100,000 hours mean time between failures.

Power-saving battery protection ICs

ABLIC Inc. has launched the S-82M1A/S-82N1A/S-82N1B series of 1-cell battery

protection ICs having a low current consumption during operation of 990nA max. The new battery protection ICs include accurate overcharge detection voltage as high as ± 15 mV while delivering low current consumption, accuracy

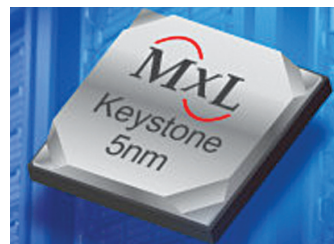

overcurrent protection not susceptible to temperature fluctuations, charge-discharge control function using external signals, a power-saving function that disables battery discharge during power-saving operation, and also lowers current consumption of the protection IC down to 50nA, minimising battery consumption to virtually zero.

Low-power CMOS signal processor for data centres

MaxLinear, a provider of radio frequency, analogue, digital, and mixed-signal integrated circuits, has demonstrated

a 5nm CMOS 800Gbps PAM4 digital signal processor (DSP) for data centre applications. This 800G DSP is part of MaxLinear's new Keystone family of 5nm CMOS PAM4 DSPs. This third generation DSP enables small form factors,
