

sensor. It is designed to work well outdoors, in bright lights, and even on difficult hot or dark surfaces. AS2100 can measure natural targets up to 100m away and reflective targets up to 500m away with an accuracy of $\pm 1\text{mm}$.

Vector network analyser

Siglent Technologies' 2- or 4-port vector network analyser is the first family of products introduced in the new A-Line in

which more devices may be expected in next 18 months. The SNA5000A network analyser offers frequency range of 9kHz

to 4.5GHz, or up to 8.5GHz. The dynamic range spans 125dB and enables, for example, a precise analysis of the stopband of a filter without losing sight of the passband. The analysers support 2/4 port S-parameters and differential S-parameter measurements. Time domain analysis can be performed with the options SNA5000-TDA (time domain analysis) or SNA5000-TDR (enhanced time domain analysis).

SOFTWARE & EDA TOOLS

Development environment

Linux Studio is a development environment designed specifically for native host development, making the features of SEGGER's top rated Embedded

Studio IDE available to all Linux application developers. With its sleek Visual Studio-style user interface, powerful project management and integrated

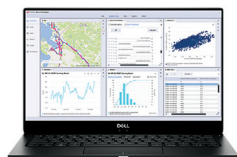

source-level debugger, Linux Studio greatly simplifies development on Linux. Linux Studio's project manager enables clear organisation of all project resources such as an executable file, additional libraries, and resources. Linux Studio also includes an integrated debugger for debugging an application at source-code level.

Analytics software

Keysight Technologies has launched Nemo 5G RAN analytics software, a fully automated cloud based solution

for streamlining data processing, as well as reporting and analytics, to speed analysis

of a mobile operator's 5G radio access network (RAN) performance. The software is based on a centralised, web based data management platform for enterprise-level analytics and reporting. It enables operators, service contractors, and network equipment manufacturers to accelerate network site acceptance, optimisation, benchmarking, and troubleshooting. It combines data analytics, built on artificial intelligence and machine learning frameworks, with an intuitive user interface to efficiently manage large amounts of data captured in a live 5G network.

Temperature control software

B&R's mapp Temperature software package provides a new pre-programmed way to get manufacturing systems up to temperature. At the push of a button, the

soft-start function heats up machine components gently to minimise heating element fatigue without any of the

tedious programming that used to be involved. Homogeneous heating reduces mechanical stresses and allows for controlled evaporation of liquid residues in the machine. With mapp Temperature's soft-start function, equipment such as filtration systems, extruders, and injection moulding machines can be brought to operating temperature quickly and easily.

Vision software

Sapera Vision Software from Teledyne DALSA offers field-proven image acquisition, control, image processing, and artificial intelligence functions to design, develop, and deploy high-

performance machine vision applications. The new upgrades to the software include enhancements to its AI training graphical tool Astrocyte and the image

processing and AI libraries tool Sapera Processing. The software is ideal for applications such as surface inspection on metal plates, location and identification of hardware parts, detection and segmentation of vehicles, and noise reduction on x-ray medical images.

ML based software

Cadence Design Systems' Cerebrus Intelligent Chip Explorer is a new machine learning based tool that automates and scales digital chip design, enabling customers to efficiently achieve demanding chip design goals. The combination of Cerebrus

and the Cadence RTL-to-signoff flow offers advanced chip designers, CAD

teams, and IP developers the ability to improve engineering productivity by up to 10x versus a manual approach while also realising up to 20% better power, performance, and area. The new tool is cloud enabled and utilises highly scalable compute resources from leading cloud providers to rapidly meet design requirements across a wide range of markets including consumer, hyperscale computing, 5G communications, automotive, and mobile.

MANUFACTURING EQUIPMENT

Measurement module

With a new bus controller, B&R has added a gate measurement module to its portfolio for efficient monitoring of machinery and processes. The module joins the X67 lineup to help keep manufacturing processes consistent
