

“Our **VISION** Is To Build A More Affordable And **SAFER FUTURE OF MOBILITY** For Emerging Markets And **DRIVERLESS TAXIS**”

The mobility landscape in India has been increasingly dynamic. But while most are focusing on electric mobility, a young engineering student is pioneering to build the first-ever fully autonomous vehicle in the country. Rahul Chopra and Siddha Dhar spoke to Gagandeep Reehal, co-founder of Minus Zero, who along with co-founder Gursimran Kalra is striving to develop self-driving technology for the unruly Indian roads. Here's what we learnt

Gagandeep Reehal (right) and **Gursimran Kalra** (left)
Co-founders, Minus Zero

Why the name 'Minus Zero'? What does it signify?

Philosophically, minus zero implies that nothing is left behind, signifying our aim for perfection. 100% minus 0 is still 100%. Mathematically, we know that negative zero doesn't exist, or neither does negative time. But if you actually go deeper, there are chances that in computer science itself, negative zero might have a lot of significance that we as humans are yet to comprehend.

And ultimately, it was also a catchy name and was good for brand building because it made people wonder since it is so peculiar, and thus stays in their mind.

What are you and your team trying to achieve with Minus Zero?

Autonomous vehicles like self-driving cars have been around for some time. For the last 6-7 years, these have been gaining a lot of traction in

the automotive industry and have also been a hot topic in the tech community. But contrary to the promises made, it's still seemingly a far-fetched goal due to capex and time-extensive technological bottlenecks in the current approaches to self-driving.

The traffic in countries like the US or the UK, or any such developed country, is very structured. If you compare that to India, the traffic infrastructure here is haywire. Anything can happen
