

```
model_info = runner.init()
labels = model_info['model_parameters']['labels']
print('Loaded runner for "' + model_info['project']['owner'] + ' / ' + model_info['project']['name'] + '"')

#Let the library choose an audio interface suitable for this model, or pass device ID parameter to manually select a specific audio interface
selected_device_id = None
if len(args) >= 2:
    selected_device_id=int(args[1])
    print("Device ID '" + str(selected_device_id) + "' has been provided as an argument.")

for res, audio in runner.classifier(device_id=selected_device_id):
    print('Result (%d ms.) ' % (res['timing']['dsp'] + res['timing']['classification']), end='')
    for label in labels:
        score = res['result']['classification'][label]

        print('%s: %.2f\t' % (label, score), end='')
        #val = ("") //
        #val=str((label,score ))
        #print (val)
        #print (val)
        if label=="hello" and score >= 0.99:
            print("Elephant Saying Hello")
            espeak.synth("He is saying Hello ")

        if label=="angry" and score >= 1.00:
            print("defected ")

            espeak.synth("Elephant is Angry ")

        if label=="happy" and score >= 1.00:
            print("he is happy ")
            espeak.synth("he is happy ")

        if label=="lets go" and score >= 1.00:
            print("Lets go ")
            espeak.synth("he is saying leys go")
```

Fig. 8: Code checking the values of output and translating the sound into human language

code, which translates the animal sounds so that humans can understand them. Create an if condition for checking the accuracy of the emotion present in the output of the ML model. If the output accuracy of 98% or more

for a particular label is detected, the output matches the label description. For example, if an animal's sound for the label "hello" meets the said percentage, the animal is indeed saying "hello."

Testing

Download the `.iem` ML model file, open the terminal, and run `animal_translate.py` followed by the path location of the ML model. Select an animal, say elephant. So, whenever the elephant makes any sound, the ML model will capture that in real time and translate what the elephant is saying to you.

Congratulations! You have created perhaps the world's first animal and bird language translator. Now you can understand

nature's language and even interact with it. **EFY**
