

Indigenous Smart Oxygen Generator

JLSR Wellness, a startup in the healthcare and wellness space, has launched a first-of-its-kind Wi-Fi enabled smart oxygen generator with an aim to bring a practical solution to the nation's dire need to breathe in the fresh air

Ayushree Sharma

Air pollution is not a hidden fact; we are all aware of it. Yet deteriorating air quality continues to be a huge problem worldwide, with India being among the worst affected. According to the Air Quality Life Index (AQLI) report by The Energy Policy Institute, the University of Chicago, air pollution will reduce life expectancy in the country by 5.2 years if pollution is not reduced.

While reduced particulate matter (PM) 2.5 and 10 levels were observed during the lockdown, the pollutant levels are rising again with the unlock guidelines in action, which can aggravate the condition of Covid-19 patients.

Giving a boost to Atmanirbhar Bharat, JLSR Wellness, a startup in the healthcare and wellness space, recently launched a first-of-its-kind Wi-Fi enabled smart oxygen generator under the brand name UrbOx (Urban Oxygen) India with an aim to bring a practical solution to the nation's dire need to breathe in the fresh air. The Made In India product was designed in partnership with leading technology companies from across the world. Anand Krishnan, COO, UrbOx, was the brainchild behind this product. He has had extensive experience in clinical research, medical devices, and drug development in the UK.

He says, "In 2019, with the spark of an idea, a group of women entrepreneurs put together a robust R&D team for the further vision of the product, and thus I got introduced to the project as the lead scientist. The women possess strong background and skills from business and trade, technology development, finance, and accounting."

The artificial intelligence (AI), machine learning (ML), and Internet of Things (IoT) configured solution has been created by fine-tuning and improvising an open source technology that was developed by NASA for its critical space missions to suit commercial and residential needs. The technology has been previously used in Apollo spacecraft.

The oxygen generator comes with
