

Truly Innovative **TECH**

Amongst hundreds of press releases of new products received by us, these are the ones we found worthy of the title *Truly Innovative Tech*

Medical images enhancing sensor

The OH02A1S provides white-light RGB and infrared monochrome captured simultaneous in a single CMOS sensor. It features 1.4-micron PureCel

pixel architecture, which offers high quantum efficiency in low-light conditions and has a high dynamic range for clarity in contrasting bright and dark scenes. The sensor can provide 1080p (1920 × 1080) resolution at 60 frames per second or 720p (1280 × 720). The OH02A1S also integrates 2 kilobits of one-time programmable memory on-chip. It consumes just 90 milliwatts at full power, generating less heat. All this makes it optimal for capturing both IR and RGB images using a single chip while surgeons can switch between high-quality RGB and IR in real-time, or view both images simultaneously for effective cancer detection and diagnosis.

Solid-state LiDAR

The Leddar Pixell is a 3D flash LiDAR having a 180-degree field of view. While it has been built for ADAS and autonomous driving applications, the LiDAR is also suitable for delivery and off-road vehicles. It has enhanced detection

capabilities of vulnerable road users up to 32 metres and blindspot coverage. The robust, solid-state Pixell compensates for the limitations of mechanical scanning LiDARs use for geo-positioning,

which generates blind areas that can reach several metres. It meets stringent shock and vibration standards that make it withstand tough environmental conditions, ensuring reliable and secure vehicle operation.

Advanced haptic drivers

The CS40L25 family of boosted haptic drivers enables product designers to create cleaner, sleeker industrial designs

by eliminating mechanical buttons. The devices are resonance-aware, drive high-performance linear resonant actuators and voice coil motors (VCMs). Ultra-low latency provides real-time control of the haptic motor for a more immedi-

ate response. Closed loop algorithms maximise LRA effectiveness and enable strong and consistent haptics with a crisper effect.

Ambient light measuring sensor

The TCS3701, an RGB light and IR proximity sensor IC, accurately measures the ambient light intensity from behind an OLED screen, thus facilitating an increase in the display area by eliminating front-facing bezels. Its ultra-high

sensitivity to light produces accurate light measurements in all lighting conditions (whereas light transmission through an OLED screen gets limited by its opacity).

Automated navigation system

The Triton is a compact and affordable solution for mapping warehouse floors. It uses a revolutionary positioning technology that enhances existing robotic products. Even if the warehouse aisles store racks, pallets, and trolleys that are low to the ground, Triton has no problem with that. Thanks to Triton's small and compact size, it manages to
