

IoRT: The Internet Of Robotic Things

The concept of usage of cloud services in robotics and the Internet of Things (IoT) opens a new domain—the Internet of Robotic Things, which could be an advanced version of cloud robotics and an extension of IoT to leverage the capability of data monitoring to machine intelligence and intelligent agents

Dr Rajiv Kumar Singh

There has been tremendous development in the field of robotics and the Internet of Things (IoT) in the past few years. Both of them seem to be complementary to boost efficiency, reduce costs, and achieve automation at large.

IoT is a system of uniquely identifiable interrelated/interconnected devices. The term IoT was first used by Kevin Ashton in 1999, and Mark Weiser is said to be the

first person to have conceived this idea in his scientific paper titled 'The Computer for the 21st Century' in 1991.

The 'connected' things in IoT are used to perform remote sensing, actuating as well as monitoring capabilities. Any natural or man-made entity that can be assigned an Internet Protocol (IP) address and can transmit data over a network is a 'thing' in the Internet of Things. IoT expands the ability to collect and transmit
