

Automatic WATER TANK FILLING SYSTEM

NAMAN TANWAR

In India, many houses have two sources of water to fill the rooftop water tank. These are underground water storage tanks and municipal water supply. Based on the availability, the rooftop tank is filled either with the municipal water or with the underground tank water with the help of an electric water pump.

Filling the overhead tank by manually switching on the electric water pump requires frequent moni-

toring of the water level inside the tanks. It also results in wastage of water when it overflows from the overhead tank. This project aims to fill the overhead tank automatically without any human intervention.

The proposed system determines the level of water in the rooftop tank, checks the availability of sufficient water in the underground tank or municipal supply, and then fills the over-
