EFY GROUP
YOURS SINCE 1969

“

Branding is what people say about you when you are not in the room.

”

-Jeff Bezos

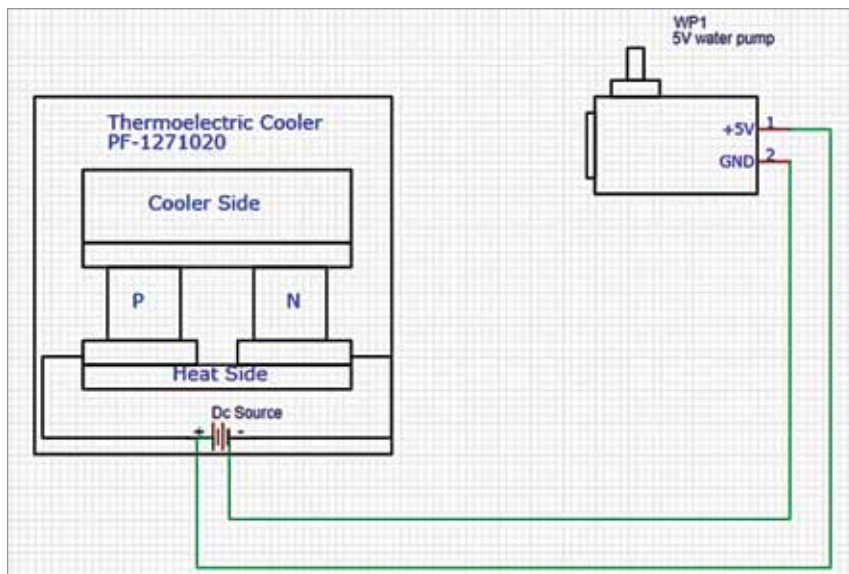

Fig. 13: Connection diagram of the project

Fig. 14: Running the code

```
mpirun -n 4 --hosts 10.0.0.1,10.0.0.2,
10.0.0.2,10.0.0.4 hostname
```

After every setup has gone well, you can test the system. Connect each node and power them all.

To test the supercomputer, download the code from <https://github.com/mrpjevans/cluster-prime>

Open the terminal of the master node and run the following in Linux terminal:

```
mpirun -n 1 python3 prime.py 1000
```

When you run the above code, the complex task of finding the prime number up to 1,000, or 4,000, or even 100,000, is divided among all the nodes in the system and the nodes process together and calculate to give you the output. Fig. 14 shows how the program runs. **EFY**
