Touchless hidden switch

SCHURTER has released a touchless hidden switch (THS) called the touchless momentary push button. The THS features a reliable time-of-flight (ToF) sensor integrated into the switch,

utilising beams of light emitted by a light source and reflected by the surrounding environment.

The ToF sensor

accurately measures the distance by calculating the transit time of the reflected light, ensuring precise distance measurement. Notably, the touchless momentary (MO) push button offers versatility with multi-colour illumination for visually appealing effects. Designed with standard sensitivity, it is suitable for glass thicknesses of up to 2mm and can be effortlessly mounted behind various materials such as glass, plastic, wood, and metal, requiring only a small viewing window for the sensor. Moreover, it is resistant to water and rain, making it suitable for outdoor use, and offers area illumination for comprehensive lighting coverage. Additionally, the switch's compact dimensions and small mounting depth make it ideal for applications with limited space.

Smart weather sensor

OMRON and Weathernews have collaborated to develop Soratena Pro, a compact and high-performance weather IoT sensor. It is capable of ob-

serving seven different elements every minute, including air temperature, humidity, atmospheric pressure, rainfall amount, wind direction, wind velocity, and illuminance. Soratena Pro finds applications in various industries

such as agriculture, construction, drones, logistics, sports, electric power, food retail, and apparel. By leveraging the observa-

tion data provided by the sensor, businesses can enhance safety measures, improve productivity, and make informed decisions. It enables real-time access to observation data, graph analysis of weather parameters, and valuable features for disaster prevention. The integration of Soratena Pro with the Weathernews application allows users to seamlessly access various contents, including paid features, such as observation data, weather forecasts, rain cloud radar, blackout risk prediction, and more. The Soratena Pro IoT sensor has extensive applications, including solar power generation forecasting, staffing optimisation in the food retail industry, and contributing to a sustainable and digitally connected society by reducing disaster risks.

High temperature IGBTs

Nexperia has unveiled a series of 600V insulated gate bipolar transistor (IGBT) devices with a current rating of 30A. The first model is named NGW30T60M3DF. The IGBT series is

designed to operate at high temperatures of up to 175°C and are equipped with fully rated fast recovery diodes. With their advanced features and

robust design, the IGBTs enable higher power density in a wide range of applications, including industrial motor drives, robotics,

elevators, power inverters, photovoltaic (PV) strings, electric vehicle (EV) charging, and induction heating and welding. The devices offer low conduction and switching losses, ensuring high efficiency and reliability even in demanding environments. They are designed with precise parameter distributions for safe parallel connection and exhibit lower thermal resistance, allowing for higher output power. The IGBTs also provide protection against overcurrent conditions and are RoHS-compliant with lead-free plating.

Anti-surge thick film resistor

Vishay Intertechnology has upgraded its Vishay Draloric RCS0805 e3 anti-surge thick film resistor, increasing its power rating to 0.5W. This resistor, available in an 0805 case size, offers significant advantages in terms

of pulse load performance and ESD surge characteristics compared to

standard chip resistors. It is well-suited for applications that are subject to high and repetitive surge pulses, making it a good choice for automotive, industrial, telecommunications, and medical applications. The RCS0805 e3
