

submarine cables. This device boasts an impressive evaluation range of up to 20,000km, with a selectable wavelength that covers the full C-band. This advanced device utilises a coherent (optical heterodyne) detection method and comes equipped with a built-in tunable wavelength light source. Moreover, it allows for the measurement of all cable lines from each landing station, ensuring the high quality and reliability of submarine cables. The MW90010B also offers improved portability, the module weighs less than 10kg, i.e., a 40% weight reduction while maintaining the same product size as its predecessor. It offers easy portability at landing station, submarine cable laying vessels, and other maintenance sites.

ENTERPRISE SOLUTION

Modular industrial computers

ADLINK Technology Inc. has introduced the MVP-5200 and MVP-6200 series, the latest additions to their MVP series fanless modular computers. Powered by 12th/13th Gen Intel

Core processors, these industrial computers offer powerful performance and

flexibility. The modular computers provide an AI-ready edge platform with built-in GPUs and machine vision capabilities, enabling optimised AI performance and real-time image analysis. The compact MVP-5200 and expandable MVP-6200 series are designed for AI-powered applications in various industries, including smart manufacturing and semiconductor equipment. With up to four PCI/PCIe slots, these computers support performance acceleration through GPUs and expansion cards. Both modules offer

a wide range of I/O options, including DisplayPort, HDMI, COM ports, USB ports, LAN interfaces, and SMA antenna connectors for 5G and Wi-Fi.

Industrial connectors

Elcom International Pvt Ltd has introduced a range of industrial plugs, sockets, and connectors designed to

provide dependable and durable

electrical connections in demanding heavy-duty and industrial environments. Featuring a dual screw connection between the cable and termination area, they offer enhanced security and robust connections. These products are designed with high-impact and heat-resistant polyamide material, making them suitable for rugged environments with a glow wire index of 850°C according to IEC standards for safety and reliability. Rated for insulation voltage up to 690V and equipped with brass contact material for excellent conductivity, these plugs and sockets accommodate various electrical needs. The products are CE certified, complying with rigorous IEC 60309 standards for quality and compliance, making them a reliable choice for industrial applications.

EDA tool for PCB designing

Pulsonix has released Pulsonix Version 12.5, a major update to the company's existing electronic design automation (EDA) tool for PCB designing. The

new version offers additional features such as the animated 3D folding for flexi boards, allowing designers to visualise their designs with

dynamic bends and curves in real-time

through realistic animations. In the new version, the bend regions can be precisely defined, including details like size, direction, and designated areas for components and vias to ensure compliance with design rule checking (DRC) requirements. The software also offers export capabilities in stereolithography (STL) and standard for the exchange of product data (STEP) formats, facilitating collaboration and integration with mechanical design teams. Version 12.5 leverages GPU acceleration for improved graphics performance and introduces QR code generation as a font style and CSV file support.

Glare removal feature for microscopy

TAGARNO has introduced a new glare removal feature that addresses the issue of glare in microscopy, improving image quality and enhancing user experience. The software intelligently controls the ring light, capturing and

analysing the sample from multiple lighting angles to produce a well-illuminated glare-free image. By selecting the appropriate setting and pressing the snapshot key, operators can easily capture clearer and more accurate microscopic images, reducing eye strain and improving comfort, efficiency, and work quality. Glare in microscopy can hinder visibility and make it challenging to observe and analyse fine details. Traditional methods to minimise glare include anti-reflective coatings and various illuminators. TAGARNO's new feature offers researchers, scientists, and professionals a practical and user-friendly solution to obtain dependable microscopic images with superior clarity and accuracy.
