

How ADAS Equipped With Inertial Measurement Sensors PROMOTES SAFE DRIVING

Want to drive safely? Discover how IMU-equipped ADAS systems are revolutionising vehicle safety and autonomy through advancements like sensor fusion and triple redundancy, shaping the future of driving for safer and smarter experiences

NIDHI AGARWAL

Inertial Measurement Unit (IMU) is crucial to present and future navigation and safety systems in autonomous vehicles and advanced driver assistance systems (ADAS). IMUs collaborate with diverse perception sensors, including light detection and ranging (Lidar) cameras and radar odometry, etc, to maintain accurate vehicle trajectory. ADAS technologies

assist drivers in various aspects of their driving tasks and provide an extra layer of safety. In this article, we will discuss how an IMU-equipped ADAS system ensures safety and what developments are happening in this field.

Incorporating inertial measurement sensors with ADAS promotes safe driving in the following ways.
