braced abstract, angular, and geometric shapes, with minimal ornamentation and clean lines. This minimalist approach rejected unnecessary embellishments in favour of simplicity. The school's philosophy was encapsulated in the famous phrase 'form follows function,' suggesting that the design of an object should be determined by its intended purpose.

Another important aspect of Bauhaus design was its emphasis on interdisciplinary collaboration. The school brought together artists, architects, designers, and craftsmen from various disciplines, fostering a creative exchange. This approach encouraged experimentation and innovation, leading to the development of new design ideas and solutions.

Bauhaus design also incorporated bold use of colour. Artists and designers associated with the movement explored the expressive potential of colour and aimed to create harmonious compositions. They often used primary colours and simple geometric shapes to achieve visual balance and impact.

The influence of Bauhaus design extends beyond its existence as a school. Many of its principles and aesthetics have had a profound impact on modern design. The emphasis on functionality, minimalism, and the integration of art and technology can be seen in various fields such as architecture, furniture design, graphic design, and industrial design. The Bauhaus legacy continues to inspire designers and artists worldwide, reflecting its enduring relevance and innovative spirit.

People-centric design (IDEO way)

IDEO is a renowned design and innovation consulting firm founded in 1991 and headquartered in Palo Alto, California. The company has gained global recognition for its human-centred design approach, collaborating with numerous clients from various industries to help solve complex problems and drive innovation.

IDEO's design philosophy revolves around the concept of empathy, deeply understanding the needs, desires, and behaviours of

the people they are designing for. This user-centred approach allows IDEO to create innovative solutions that resonate with end-users.

The firm employs a multidisciplinary team of designers, engineers, social scientists, business strategists, and other professionals, enabling them to tackle a wide range of challenges. IDEO utilises a collaborative and iterative design process, often referred to as design thinking, which involves stages such as research, brainstorming, prototyping, and testing. This process helps generate and refine ideas, ensuring the final solution is both functional and desirable.

IDEO's portfolio spans various industries, including technology, healthcare, education, consumer products, and social impact. They have worked on diverse projects, such as designing user-friendly digital interfaces, creating innovative medical devices, developing sustainable packaging solutions, and reimagining public space layouts.

Notably, IDEO created the first commercial computer mouse for Apple in the 1980s and developed the

first foldable laptop design. Their design thinking methodology and innovative approach have been widely recognised and emulated by other organisations and institutions worldwide. IDEO's work has received numerous awards and accolades, solidifying its reputation as a leader in design and innovation.

IDEO's work and design philosophy have inspired many designers and organisations
