## High-powered inverter and military-grade film capacitors

New Yorker Electronics has introduced Electrocube's 985B series of double metallised polypropylene film capacitors, engineered explicitly for high-powered inverter applications. The capacitors are designed to withstand

high surge currents without degradation, offering a durable and non-inductively wound solution for

high-current applications. The capacitors are suitable for high-powered inverter applications, demanding military and commercial land and sea deployments, AC power systems, and renewable energy sources like solar, wind, and steam. They feature a protective clear wrap, extended electrode construction, and tin-coated, oxygen-free solid copper leads. Operating effectively from -55°C to +105°C at rated voltage, with tolerance options up to ±1%, they accommodate frequencies up to 100kHz and are available in both RoHS and non-RoHS configurations. Their versatility extends to customisable insulating sleeves, mounting options, specialised terminals, and other hardware components. These capacitors are also used in electric vehicles, and robotics.

## Compact Bluetooth and Wi-Fi 6 modules

u-blox has introduced the MAYA-W3 family, a range of compact dual-mode Bluetooth low energy (LE) 5.4 modules featuring LE Audio. These modules support Wi-Fi 6/E and are

engineered for robust industrial applications like healthcare, industrial automation, asset tracking, and smart home systems. They offer flexible antenna pairing options, such as antenna pins or U.FL connectors, and include an LTE filter for compatibility with other technologies. The variant chosen depends on specific performance needs. The modules are designed to leverage the benefits of Wi-Fi 6 and the 6GHz band, addressing network congestion and improving power efficiency. They help designers keep pace with market trends, maintaining the same compact size as their predecessors for easy generational transition. Featuring Bluetooth LE Audio for voice communication and broadcasting, all variations have global Wi-Fi and Bluetooth certifications, making them versatile for a wide range of applications.

## SPDT switch for high-performance RF applications

Analog Devices's ADRF5022 is an electronic component designed explicitly as a single-pole, double-throw (SPDT) switch, produced using

advanced silicon manufacturing processes. The switch sets itself apart with a rapid on/off switching capability, featuring a swift response time of just 20 nanoseconds, and stands out for its broad operational range, rapid

switching, excellent isolation, low signal loss, and efficient power management. It delivers up to 60dB isolation between

input and output ports, with minimal signal loss, indicated by an insertion loss of less than 2.3dB. Compatible with CMOS and LVTTTL control signals, it seamlessly integrates into various electronic systems and can operate effectively with a single positive supply voltage. The compact switch is suitable for applications in test and instrumentation, cellular infrastructure, military radios, radar systems, electronic countermeasures, microwave radios, VSATs, and industrial scanners, highlighting its versatility and indispensability in a wide array of electronic applications across multiple industries.

## EMBEDDED

### SMARC 2.1 SoMs with advanced AI features

ARIES Embedded has introduced the SMARC-certified system-on-modules (SoM)—MRZG2LS and MRZV2LS. The SoMs align with the SMARC 2.1 (Smart Mobility Architecture) standard Standardisation Group sets for Embedded Technologies (SGET).
