

accuracy. It is fully automated, boasting yields over 99.5%, and offers a low total cost of ownership, effectively reducing manufacturing costs. Suitable for a range of RFID applications across various sectors, including retail, automotive, access control systems, railway tickets, airline luggage tags, and shipping containers, the equipment integrates features common in the semiconductor industry. These include automatic wafer change for 20.3cm and 30.5cm (8- and 12-inch) wafers and multiple high-resolution cameras for step-by-step inspection. Unlike other RFID die bonding equipment that is limited to transparent materials, this RFID inlay die bonder can handle both transparent and opaque web materials.

A MEGABOOK offering fusion of power and innovation

TECNO has launched the MEGABOOK T1, setting a new benchmark in India's Artificial Intelligence of Things (AIoT) landscape. Designed for those

who prioritise both effectiveness and elegance, it effortlessly reflects their refined style. Added convenience and elegance are epitomised by its one-handed lid opening feature, providing an extra touch of user-friendliness. It has earned Technical Inspection Association (TUV) Rheinland Eye Comfort Certification to ensure eye protection during extended usage. The included 65W PD (power delivery) ultra-fast charger maximises productivity by minimising time tethered to a power socket. The expansive vapour cooling (VC) mechanism maintains the laptop's ideal temperature, even dur-

ing resource-intensive tasks, providing seamless multitasking and rapid data retrieval without delays. Security and privacy are prioritised with a 2-in-1 power button integrated with a fingerprint sensor, establishing a secure personal space.

AI-driven CAD modelling engine

Ultra Librarian has announced a new AI-driven CAD modelling engine to reduce the time it takes to build CAD models. Ultra Librarian's AI-driven CAD modelling engine is expected to reduce the build time to seconds. Many obvious tasks can now be handled by the AI providing designers with an opportunity to focus better on innovation. The team is currently training the new AI models using their extensive library, which comprises over 16 million CAD models. They are also actively investigating additional potential use cases for these models. The beta version of the AI-powered CAD modelling engine is scheduled for release in early 2024.

Micro-thermal camera with 160 degrees view

Teledyne FLIR has announced the first micro-thermal camera module

with an ultrawide 160-degree field of view (FOV), the Lepton UW. It is compact enough to fit on the tip of a finger. The module features a 120 x 120 thermal resolution and a scene dynamic range of up to 400 degrees Celsius, along with unmatched thermal sensitivity of less than 50mK and integrated digital thermal image signal processing capabilities. It's suitable for applications needing a wide field

of view, such as fire detection, process monitoring, and people counting. For people counting in particular, the Lepton UW provides a dataset that avoids overcounting through glass and ensures privacy. When integrated with building automation software, it aids facility managers in optimising energy usage, occupant comfort, and work-space management.

Telematics Hub boosts fleet and vehicle management

iWave has released a Telematics Connect Hub designed for fleet manage-

ment and telematics in electric vehicles (EVs), racing motorcycles, and industrial and off-road

machinery. Equipped with an Arm Cortex-A7 microprocessor, the hub includes 2 CAN-FD ports, GNSS, an accelerometer, and gyroscope, and an integrated hardware secure element for enhanced security in vehicle connectivity. The integrated hardware secure element is crucial for ensuring security in connected vehicles, supporting various functions like secure firmware updates, CAN message authentication, HDCP cryptographic support, and EV battery authentication. This telematics connect hub is particularly useful in EVs, providing data on driver and vehicle performance, battery health, charging schedules, and station analytics. It's also beneficial for motorcycles, off-highway vehicles, and industrial machinery, aiding in fleet management, navigation analysis, and diagnostics. It features a Linux board support package with APIs for peripheral integration, allowing custom software and analytics development, including data logging, edge computing, and cloud integration, with support for OTA software updates.
