

# WATCHBOT INTRUDER DETECTION

## Using Pi Camera And VIDEO STORAGE With Telegram Bot

DR GEETALI SAHA AND PARTH SHAH

Vigilance of remote locations on your mobile is an assurance for many individuals across the globe. In our last article, we shared information about intrusion detection using a PIR sensor and how to store captured images on Firebase, an open source Google Cloud tool. This time, we have included video storage using the Telegram app. Our proposed setup is illustrated in Fig. 1.

Here, a PIR sensor connected to a Raspberry Pi checks for intruders in a room using a motion sensor. If it detects human movement, it captures frames from the camera and sends them to your Telegram bot. Fig. 1 depicts the author's prototype of the observation zone where slight hand movements activate the Pi camera, recording a 5-second video. The bill of materials for this bot is listed in Table 1.

**EFY note.** Additionally, you will need a 16GB SD card and a 5V 2A DC power source if you already have a Raspberry Pi.

### Connection

Fig. 2 shows the circuit diagram of intruder detection using a Pi camera

#### BILL OF MATERIALS

| Components              | Quantity | Description          |
|-------------------------|----------|----------------------|
| Raspberry Pi 4b+ (MOD1) | 1        | For programming      |
| PIR sensor (S1)         | 1        | Motion sensor        |
| Pi cam                  | 1        | 5MP Pi camera        |
| Jumper wire             | 3        | Female-female jumper |
