

such as smart factories, smart homes, medical devices, and smart metering. It ensures hardware and software compatibility, allowing for seamless integration and scalability based on specific requirements. With a balanced combination of security, perfor-

mance, and scalability, the SoM serves as a cost-effective foundation for Linux edge devices. It provides dual Gigabit Ethernet,

dual USB ports, and essential I/Os for flexible connectivity. Built on the 45mm x 45mm OSM Size-L standard, the SoM offers exceptional durability through direct soldering onto the carrier card, making it suitable for vibration-sensitive products. Based on the 64-bit ARM architecture, the SoM incorporates Wi-Fi 6 and Bluetooth 5.3 capabilities. The i.MX 91 applications processor family from NXP ensures high performance, pricing, and security, providing scalability with reduced development cost and time to market.

HMI for e-bikes

Foxconn Interconnect Technology has launched the Xion E-Bike human-machine interface (HMI) system, utilising Nordic Semiconductor's nRF52840 SoC for Bluetooth Low Energy (LE) connectivity. The HMI system combines a bike display with a control-

ler, allowing riders to view riding metrics and switch between

assistance levels, including a unique 'walking mode' for pushing the bicycle. With a compact design and high luminance display, the Xion E-Bike HMI system offers enhanced visibility and convenient mounting on the handlebars. The nRF52840 SoC facilitates data transmission of crucial metrics such as speed and range to a corresponding app on the user's

smartphone or tablet. The system is hardwired to the bike's battery for continuous operation and displaying charge levels. With features like a 5cm colour TFT-LCD, IPX6 rating, USB-C reverse charging, and intuitive UX/UI operation, the Xion HMI system provides an ergonomic and informative riding experience.

Multi-camera solution

e-con Systems has released a multi-camera solution that can enhance the capabilities of Qualcomm Robotics RB5 Kit, which is a heterogeneous computing platform that integrates advanced connectivity and high-accuracy AI technology.

The e-con module enables the integration of up to 6 cameras to the RB5

kit. The multi-camera systems are commonly used in various applications, including surveillance systems, video production, computer vision, robotics, and virtual reality. The e-con multi-camera solutions are designed for drones, delivery robots, and autonomous shopping systems applications. The multi-camera solution will enable product developers to completely utilise the capability of Qualcomm's robotics kit and take their vision to the next level with rapid prototyping.

Dev kit for mmWave antenna module

Rohde & Schwarz, in collaboration with Fujikura and Avnet, has introduced a development kit for 5G millimetre Wave (mmWave) phased array antenna modules. The kit is designed to facilitate over-the-air (OTA) testing and evaluation of 5G mmWave systems in an open environment. It enables system architects to prototype

and optimise tuning parameters for 5G mmWave systems, offering a compact and versatile solution for characterising antennas, modules, and devices within the 20 to 50GHz range. The kit utilises compact antenna test range (CATR) technology, providing a highly

accurate 20cm quiet zone for precise measurements. With an

approved indirect far-field method by 3GPP, the system ensures reliable and accurate results. It offers convenient access to the device under test (DUT) and can optionally include an internal enclosure for extreme temperature tests. The kit supports dual-polarised polarisation, features 2mm x 2.4mm RF connectors, and has a DUT load capability of 2.5kg.

Analogue signal generator

The Anritsu MG36271A is an analogue signal generator with a frequency range of 9kHz to 70GHz. It addresses the needs of industries such as aerospace, defence, communications, and

research by offering exceptional signal purity, output power, and frequency stability. Leveraging the performance of the Rubidium series, the MG36271A delivers superior results in higher-frequency applications. It boasts outstanding phase noise performance and low harmonics, ensuring high signal purity. With a robust output power of +9dBm at 70GHz, it caters to diverse measurement applications in the Q/V band. The device offers comprehensive modulation, frequency sweep, synchronization, and level control capabilities, supporting various modulation types and extensive pulse generation for testing pulse radars.
