keep a steady pipeline of work or customers. For any new salesperson joining, having this process can set them up for success. Combine it with appropriate collateral and assets to maximize, and you would have made them unstoppable.

**6. Customer's journey.** A customer's journey in your business context is the path your customer would follow to acquire your product or service, then use it, and eventually continue using it or detach from it.

At each step, the customer is in a different state of mind, with different questions, struggles, and likely different circumstance. Knowing that can be tremendously helpful in building your processes around the customer's journey. This way, your customers can feel and experience more value, leading to better engagement and, overall, a

win-win situation.

**7. Tools, systems, and collaterals.** As mentioned above, every step in a customer's journey requires a different approach and interaction. Customers ask different questions, and they might need different things to help them with.

It could be a simple information brochure, diagnostic tool, free key-chain, a how-to video, or something entirely different. As long as you have those things ready, you will be good. Many of these collaterals are also known as cornerstone artefacts. Having appropriate tools to track progress and deliver on the collaterals is equally important.

Keep one thing in mind though—at any of these stages in the customer's journey, until the time is right, you don't want to be salesy. Keep it shareable, maintain infotainment value, and it will help.

## The point is...

Setting up the frontend over the backend must be prioritised. Not because sales or marketing are important, but because that's what customers see first, and they are the first moments of truth.

Additionally, having ways to measure and track customers' journeys can be immensely helpful. Because when the market shifts, you want to know that it has shifted, or better yet, you want to know that it is shifting so you can adapt better and faster.

Always remember customers' journeys keep evolving. So any system or asset you design must evolve simultaneously. There's no point in building a concrete road when people keep walking different paths every day. Adaptability and flexibility are the key attributes here and always. **EFY**
