

For testing, power the lidar and Raspberry Pi and run the code. It will start alerting you if your vehicle comes close to anyone (or anything), so you may slow down and take care. If you want to get the map of surroundings, you can do that as well. The testing data is shown in Fig. 11.

With this the first part of the project is ready. Next, you need to integrate it with wiring and braking system of a vehicle or robot, which will be covered in Part 2 of this article next month. **EFY**

Bonus. You can watch the video of the tutorial of this DIY project at <https://www.electronicsforu.com/videos-slideshows/adas-system-anti-collision-system-using-lidar-for-evs-autonomous-vehicle>
