Gaming DRAM

The CVN ICICLE DDR5 from Colorful Technology is a new dynamic random access memory (DRAM) for high-end gaming applications. It is one of the fastest in the market offering data-transfer speeds of up to 11,139MT/s.

The RAM also supports Intel XMP 3.0 technology that allows users to boost performance with

ease via the BIOS by activating the predefined and tested Intel XMP profile. The memory features a heatsink that increases the surface area, and features an addressable RGB LED light that improves the look of the RAM. The ARGB light bar is fully customisable using the iGame Center app and supports RGB synchronisation with popular motherboard RGB sync technologies from ASUS, MSI, ASRock, and GIGABYTE.

Liquid flow sensor

SLF3S-4000B is a liquid flow sensor from the Swiss manufacturer Sensirion. The SLF3S-4000B employs a

W-shape channel profile to overcome the hydrodynamic limitation in the new high-flow sensor,

thus achieving better accuracy. The accurate flow measurement sensor will enable researchers to measure high flow rates while negating the effect of turbulence caused due to higher flow velocities or larger channel cross-sections, thus enabling the

sensor to be placed along the narrower side stream (with the laminar flow), therefore providing high measurement accuracy.

Integrated SoC for IoT

Nordic Semiconductor's nRF54H20 is ideal for Internet of Things (IoT) applications demanding high processing power, excellent energy efficiency, and

state-of-the-art security. The SoC is powered by multiple Arm Cortex-M33 processors and multiple RISC-V

coprocessors. The SoC's high level of integration will enable developers to shrink their designs by replacing multiple components, such as MCU, external memory, and wireless SoC, with just one highly compact device. It can be used for complex machine learning and offers support for sensor fusion at the edge. The nRF54H20 SoC is suitable for applications such as advanced wearables, smart home, and LE audio.

Waterproof speakers

CUI Devices has introduced the CMS waterproof speaker series to its existing line of speakers. The speakers

employ high-quality Neodymium magnets, and the IP-rated

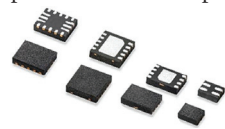

models carry resonant frequencies from 180 to 1,200Hz. The speakers run on nominal inputs of 0.8 to 3W,

and impedance ratings of 4 or 8 ohms. These waterproof speakers come in rectangular or round frame shapes, solder pad or spring contact mounting styles, and PEEK, PEI, or PET cone types, making it easier for designers to fit a speaker without having to modify the design of their product.

5 to 28V e-Fuse

The new range of e-Fuse from Littelfuse is a single-chip, e-Fuse Protection IC for 5 to 28V applications. It provides faster response time, highly

accurate current limiting, and more integrated protection, control,

and sensing features than traditional fuses and PTCs, which enhance the safety of the system while reducing the cost and size of the device. The e-fuse can reduce the design-in phase, PCB space requirements, BoM cost, and time-to-market compared to typical discrete solutions. These semiconductor based electronic fuses offer various safety features, such as overvoltage, overcurrent, short circuit, and inrush current protection. They also feature reverse current blocking, under voltage lockout (UVLO), soft start, and overtemperature protection with real-time diagnostics. The eFuse is suitable for use in various applications, including portable electronics, wearables, enterprise servers, power tools, etc.

Half-bridge driver ICs

Infineon EiceDRIVER 2ED132xS12x 1200 V is a 1,200V half-bridge driver IC series with active Miller clamp for
