Wideband radio monitoring module

RFeye Array 300 is a high-performance, twin-channel system for simultaneous wideband radio monitoring and direction finding by CRFS. It is an

intermediate-sized spectrum monitoring and direction-finding system for vehicle-mounted deployment or

fixed installations. It is designed to maintain accuracy, even in extreme environmental conditions and requires fewer scheduled recalibrations than most competing products. The Array 300 uses a unique multi-layer approach that is said to be more sophisticated and versatile than traditional direction finding. Moreover, the Array is sensitive to most incoming signal polarisations, including all linear polarisations, allowing reliable detection of signals, including those invisible to most DF systems. The RFeye Array can be used for accurate geolocation of target signals using the combined angle of arrival (AOA), time difference of arrival (TDOA), and power of arrival (POA) techniques. The module is suitable for use in both civil and defence applications and is suitable for applications such as spectrum sweeps, IQ captures, and spectrum occupancy measurements.

Inline AOI system

Mek iSpector inspection system from Marantz Electronics is a low-cost AOI system targeting low-volume high-mix production facilities. The new

AOI system is an entry-level system, specifically designed for customers with low volume, high mix production, requiring cost-effective AOI solutions. It uses cameras and specialised

image processing algorithms to automatically examine the visual appearance of objects or components. The iSpector system utilises DOAL, main

and side LED light sources from three different angles, creating a meniscus profiling light pattern that allows for the inspection of component bodies and solder joints. It can detect various types of defects, including missing components, incorrect component placement, misalignment, soldering defects, scratches, and surface contamination. The system is equipped with Mek Colour Histogram analysis, which provides accurate and reliable inspection results with low false calls.

EMI test receiver

R&S EPL1000 from Rohde & Schwarz is an EMI test receiver for emission measurements up to 30MHz. The R&S

EPL 1000 is CISPR 16-1-1 compliant and suitable for certification

measurements. The measurement instrument also reduces uncertainty in pre-compliance measurement tasks. The EPL1000 can give reproducible and standard-compliant test results, thus ensuring high product quality. It features a pulse-protected input and an auto-ranging function that prevents the overloading of the signal processing chain to ensure correct measurement results. It also offers the fast time domain scan that lets the R&S EPL1000 check all frequencies in CISPR bands A or B in a single shot for quick and seamless measurements over extended periods of time.

Furthermore, it features an optional integrated continuous wave signal generator with a tracking generator function that characterises used accessories and cables without the need to use an external signal generator. The R&S EPL1000 is ideal for conducting voltage and current emission measurements.

MISCELLANEOUS

Smart soldering tweezer

WXsmart tweezers from Weller Tools is a smart soldering solution designed to meet various soldering and desoldering needs. The smart tweezer

offers advanced features, such as traceability and connectivity requirements, and is suitable

for use in both miniaturised and heavy-duty applications. The desoldering tweezers can simplify soldering for SMD rework, making them suitable for chip components, small outline packages, quad flat packs, plastic leaded chip carriers, and small outline integrated circuits in heavy-duty applications. These high-performance tweezers feature built-in intelligence and impeccably calibrated tips, offering time-saving benefits. The colour lighting feature enables quick tool identification, and the enhanced soft grip design improves ergonomics for repetitive tasks. The tweezers have a short-distance tip-to-grip and parallel sliding block design that allows a comfortable grip, ensuring higher precision and comfort during work. The WXsmart tweezers offer short heat-up times, maximum precision, precise positioning, and adjustability functions, making them a versatile tool for soldering and desoldering applications.
