

manufacturing industry in India. India is at a growth stage and Winbond is following the trend. The Indian government's "Make in India" program gave us the chance to work on multiple business opportunities from different market segments.

Q. Which customer segments provide the maximum business from India and what are the reasons for this trend?

A. We are working on multiple segments for the Indian market but we see the automotive, industrial, and telecom sectors as promising markets.

With the introduction of the 5G network in India, the demand for memory storage has risen. The automotive industry is moving towards electrification. Innovation is happening at tremendous speed. Key components for electrification, such as batteries, battery management systems, EV chargers and charging stations, car gateways, engine control units, body control modules, telematics units and digital clusters, require different ranges of memories. Similarly, The need for memory has risen due to industrial automation, M2M, remote monitoring systems, industrial IoT, smart homes, smart energy-related applications etc. All of these applications have resulted in a demand for memory storage products in these segments.

Q. With many memory brands in the market, what are the unique factors that make Winbond stand out and grow in such a competitive market?

A. During the pandemic, the electronics manufacturing industry was plagued with an

acute shortage of components and semiconductor chips but the unique thing about Winbond is that our supply has always been stable. This is because we have our own fabrication and process technology. We also have a very strong relationship with raw material suppliers for a long time now. It helps us to provide better support to our customers during difficult times. We have an entire range of products for speciality memory ICs and we are well prepared, focused and committed to this market segment. These are the key points that make us unique and competitive.

Q. What does the growth of IoT mean to you?

A. With IoT, the need for security is becoming all the more pertinent, robust solutions for trusted boot and firmware updates are indispensable to the IoT security foundation. Our TrustME Secure flash products secure the code and data storage for trusted boot and firmware updates using external secure flash. They are available in two different series based on different security levels – the W77Q series for substantial security and the W75F series for high security.

Q. Any exciting products which have recently been launched or about to be launched?

A. Our 8Gb DDR3, 4Gb DDR4, and 8Gb DDR4 are under development and we expect the engineering samples to be available soon. We've also developed mobile DRAM devices with a low Idd current (supply current) value, which helps us to extend its applications beyond the mobile phone and tablet market to areas of mobile consumer electronics and mobile communication. ■
