3 Ushering In A New Vayve Of e-Mobility With Solar Cars

1 AN EV COMPANY ON A MISSION TO EMPOWER WOMEN

ETO Motors is a 360-degree electric mobility solutions company with the aim to contribute towards the upliftment of society by focusing on three Es: Environment, Employment, and Empowerment

ETO Motors is an electric vehicle manufacturing company that designs, develops, and manufactures electric three-wheelers for the passenger and cargo segments. The company has three verticals, including the manufacturing of three-wheelers, electric vehicle charging, and providing last-mile mobility services to companies such as Amazon, Flipkart, Big Basket, and others. ETO offers two models of modular three-wheelers, called Trilux and Bulke Plus, which provide different sizes of cargo boxes that can be retrofitted according to

customer requirements.

What sets ETO Motors apart from other automotive companies is its goal to empower women and design driver-centric vehicles. Karthik S.

Vikram Sinha (L), and Dr Karthik S. Ponnappula (R)

Ponnappula, Director of ETO Motors, explains, “Our USP is that our vehicles are designed and developed as EVs, rather than converting a traditional IC three-wheeler into an electric vehicle.” To enhance the comfort, safety, and ease of driving these cargo vehicles, the company has added rear backup cameras, bucket seats, and seat belts, and utilises high-strength materials to improve vehicle robustness and safety.

ETO Motors has trained hundreds of young unemployed women to drive electric autos in the 100% electric mobility city of Kevadia in Gujarat. The company has deployed over 300 electric autos at metro stations in Delhi, all driven by women who provide last-mile connectivity services to commuters using the metro service. Dr Karthik adds, “The women-led passenger electric vehicles in the Statue of Unity and DMRC have been a very successful business model for us.

But aside from that, the key was giving local women the opportunity to take charge of their own homes and lives.”

ETO Motors is also collaborating with Germany’s Quantron to develop retro-fitment kits for trucks, allowing truckers to convert IC engine trucks into electric trucks.
