

The minister underlined the government initiatives under the Semicon India and Digital India RISC-V (DIR-V) programmes.

### IIIT Hyderabad and Silicon Labs enter Phase II of partnership with Wi-SUN

IIITH Smart City Living Lab will be collaborating with leading wireless tech company Silicon Labs to launch a campus-wide Wi-SUN backbone Mesh network at IIITH Living Lab supporting Field Area Network (FAN) 1.1 specification. Wi-SUN is an open-standard protocol enabling interoperable solutions through open source software with multilayer security. It is noteworthy that in Phase 1 the partners launched the Wi-SUN backbone Mesh network last September to enable research and solutions for the Internet of Things (IoT) and smart cities. In the current phase, 30 more Wi-SUN router nodes have been deployed on the campus with nodes containing Silicon Labs' radio EFR32FG25 modules.

### IIT Kanpur and Lohum collaborate for research on sustainability of Li-ion batteries

One of India's leading producers of sustainable energy transition materials, Lohum Cleantech, and the Indian Institute of Technology (IIT) Kanpur recently announced a strategic partnership for R&D collaboration in sustainability and other core areas. The partnering entities aim to develop technologies important for ensuring the safety and longevity of batteries. In addition to helping IIT Kanpur commercialise its research outcomes, Lohum will also provide fellowships to select PhD students. Both partners have the shared goal of reducing the carbon footprint of EV batteries and accelerating the energy transition.

### Tata Tech and TiHAN IIT Hyderabad join forces to develop software-defined vehicles

Tata Technologies recently signed a Memorandum of Understanding

(MoU) with TiHAN IIT Hyderabad to collaborate in the areas of software defined vehicles (SDV) and advanced driver assistance systems (ADAS). The partnership aims to develop SDVs with the latest technologies to provide a solution to the challenges faced by automotive companies. The partners will jointly develop platforms and proofs of concept, and will also work to enable upskilling and hands-on training for Tata Technologies engineers at TiHAN in new technology areas.

### Semiconductor and components sectors to create 300,000 jobs by 2025-26

After recently conducting a skill gap study on the semiconductor industry in India, the Electronics Sector Skills Council of India released a white paper on the workforce requirements in the industry. It predicts that the Indian semiconductor industry—estimated to be close to \$82 billion in 2021-22—is set to cross the \$150 billion mark in the next five years. The said study named embedded systems design as the dominating aspect in the Indian semiconductor design market, grabbing around 85-90% share of the revenue. According to the estimates, this sub-sector will employ around 139,000 personnel in the year 2021-22, and it is expected to employ around 300,000 people in various roles by the year 2025-26.

### Polymatech Electronics introduces Made in India sapphire wafers

Claiming to be India's first semiconductor chips manufacturer, Polymatech Electronics recently introduced a range of high-quality sapphire substrates—including two-, three-, and four-inch diameter sapphire wafers—in the market. The recent augmentation of the company's infrastructure has increased its ability to manufacture large-diameter sapphire wafers at scale. The company said that industries producing smartphones, large displays, traffic lights, HDTVs, tablets, netbooks, and light bulbs that leverage LEDs are set to benefit from its ability to produce larger wafers. With the goal to make sapphire wafers more accessible and affordable to Indian and global customers, these wafers are being produced in the Oragadam facility in Tamil Nadu.

### Renesas introduces a new NB-IoT chipset for India

Leading supplier of advanced semiconductor solutions Renesas Electronics Corporation recently introduced an NB-IoT (Narrowband Internet of Things) chipset, especially for the Indian market. The company said that its new LTE NB-IoT modem chipset, named RH1NS200, is designed to operate seamlessly on the networks of all major Indian telecommunications carriers, and can be used in asset tracking, lighting, security, and other applications. It added that customers can use it to build
