gathered from NLP, and reprocess the answer given by ChatGPT into a human voice using NLP.

You can use any laptop, but I chose the Raspberry Pi to run all this. For capturing the voice for recognition, I attached the voice

bonnet; a USB microphone can also be used with Raspberry Pi. However, if you are using a laptop to run the VoiceGPT code, there is no need for a USB microphone; you can use the laptop's inbuilt microphone.

We now need to create an account and log into ChatGPT (see Fig. 2).

Next, we need to get the API key for doing research and experimenting with the ChatGPT code, as shown in Fig. 3.

You can create the API key using the right-corner option for API in
