

ASUS IoT brings innovative solutions like Tinker V, PE200U Edge Computer for SMEs

ASUS IoT, the global AIoT solution provider expanded its IoT portfolio with the Tinker V – a versatile single-board computer (SBC) powered by a 64-bit RISC-V-based processor and PE200U, an AI edge-computing solution.

Embracing open-source RISC-V architecture for enhanced IoT developer choice and flexibility

The Tinker V is powered by a 64-bit RISC-V-based processor that supports both Linux Debian and Yocto operating systems. The RISC-V processor in Tinker V employs the open-source Instruction Set Architecture (ISA), based on Reduced Instruction Set (RISC) principles. Compared with traditional x86 and Arm platforms, the defining benefit of RISC-V is that ISA is open source. Both individual developers and enterprises can change, optimize and deploy freely based on the RISC-V architecture – bypassing licensing and copyright fees.

Ideal for industrial IoT applications

The all-new Tinker V SBC is specially designed to run Linux Debian and Yocto. Featuring an ultra- compact size, it provides impressive power, comprehensive functionality and rich connectivity – making it the perfect choice for a diverse range of industrial IoT applications.

Specially, Tinker V is equipped with a Renesas RZ/Five MPU, which incorporates the RISC-VAndesCore™ AX45MP single-core supporting 1.0 GHz operating frequencies. It is also engineered with a broad spread of peripheral connectors for industrial use, including GPIO, micro-USB, dual gigabit Ethernet, a pair of CAN bus interfaces and two RS232 COM ports. It also benefits from 1 GB of built-in RAM and an optional 16 GB eMMC, while supporting a wide range of operating temperatures from as low as -20°C to as high as 60°C.

Furthermore, with the purchase of Tinker V, customers receive the assurance of at least five years of support from ASUS IoT, and dedicated on-site technical support is available to shorten customer development cycles and accelerate application deployment.

AI edge-computing solution

The PE200U is an AI edge-computing solution with a pre-built Windows-based AI engine connected to an 8K IP camera that can be used for counting people as well as detecting gender and age with high accuracy.

Designed for performance and silent operation in extreme environments, the ASUS PE200U edge computer can achieve full CPU utilization with a fanless thermal solution in a sealed enclosure. Enhanced features ensure optimal performance, the flexibility to adapt to various environments, easy configuration with a wide range of power inputs (12~24V) and operating temperatures (-20°~60°) and diverse I/O interface and expansion options, including PoE and GPIO for multiple vertical markets.

ASUS PE200U is built for 24/7 stability and reliability, combined with world-class after-sales service and guaranteed long-term availability to maximize the user's investment for the entire product lifecycle. PE200U offers a high-quality, TCO-optimized solution for users' AIoT computing needs.

Available as a package with PE200U, ASUS Intelligent Edge Console is an exclusive software suite that provides services for a variety of ASUS hardware devices. It includes device management, remote monitoring and control, and data visualization, making it ideal for all kinds of AI and machine-learning applications and environments.
