

and output voltage from 0 to 8V. The high-efficiency front end is accompanied by two low-noise, low-dropout regulators. The module is designed to power digital loads and can reduce output ripple voltage by up to 70% compared to discrete devices without a barrier. The micro module is suitable for a wide range of applications, such as data converters, radio frequency transmitters, field programmable gate array inputs/output and clock designs, operational amplifiers, transceivers, and medical scanners.

Supercapacitors for automotive electronics

KEMET FMU series is a high-performance supercapacitor for automotive electronics. This series delivers 1,000 hours at 85°C/85% RH-rated voltage with operational temperature ranging from -40°C to 105°C. The miniature

supercapacitors use a proprietary aqueous electrolyte solution that provides high durability against

liquid leakage, vibrations, and thermal shock, thus high reliability in harsh environments. These supercapacitors are qualified to an automotive testing protocol. The FMU series capacitors are manufactured in an ISO TS 16949 certified plant and are subjected to PPAP/PSW and change control. Additionally, these supercapacitors offer power backup in equipment ranging from IoT devices, smart meters, medical devices, and industrial computing. The high-performance supercapacitors

are ideal for automotive applications needing a main power system backup during a power loss, such as ADAS, autonomous vehicles, and central gateway ECUs.

Integrated synchronous rectifier power ICs

The GaNSense Control family from Navitas is an integrated synchronous rectifier power IC that combines next-gen gallium nitride (GaN) power

with high-frequency control functionality. It offers the benefits of the monolithically-integrated GaN power FET and GaN drive,

plus control and protection circuits, in a single surface-mount package for high-density charger, adaptor, and auxiliary power applications. The IC works at a high frequency of 225kHz, which results in a compact system size and weight. Integrated features, such as loss-less current sensing, high-voltage start-up, and elimination of VDD inductor, reduce component count and increase system efficiency. GaNSense Control offers a transient voltage breakdown of up to 800V and no PCB hotspots. The GaN based IC is suitable for use in applications such as mobile fast chargers, home appliances, data centre auxiliary, and industrial auxiliary.

Linear regulator

RECOM R-78Kxx is a series of high-efficiency three-terminal switching

regulators, which are voltage regulators that use a switching topology to regulate the output voltage. They typically consist of a power switch, an

inductor, a diode, and a capacitor. The power switch rapidly switches

on and off, creating a high-frequency signal that is passed through the inductor to create a stable output voltage. R-78 series is a replacement for the company's existing three-terminal, TO-220 style linear regulators and offers savings of energy, board space, and cost by eliminating heatsinks and assembly overheads. The series can work with input voltages up to 36V and offers efficiency up to 96%. It features various protection features, including under-voltage lockout and short-circuit protection with automatic recovery, and can meet EN 55032 class B EMC specifications with a simple input filter. R-78Kxx series can be used for a wide variety of applications, including applications in embedded circuits to provide a constant input to a processor, sensor, display, etc.

e-Fuse for demanding applications

The new range of e-Fuse from Littelfuse is a single-chip protection IC for 5 to 28V applications. The e-Fuse provides faster response time, highly

accurate current limiting, and more integrated protection, control, and sensing features than traditional fuses
