

For some time, let us cut the chat and focus on the GPT!

AI is everywhere, how is ChatGPT different?

AI is all around us. From Netflix recommendations and browser ads to a game of chess, and those decision-influencing insights that a banking platform's dashboard provides, it is all artificial intelligence. By now, we are all used to specific intelligence—being smart at one or few things (which applies to most of us also!). Yet, the kind of general intelligence and conversational skills displayed by OpenAI's ChatGPT makes one's nerves tingle—in anticipation, and in fear.

“There are two main differences between ChatGPT and traditional conversational AI models: the technology and user experience,” remarks Anurag Sahay, CTO and Managing Director - AI and Data Science, Nagarro.

In terms of technology, ChatGPT distinguishes itself by being based on the most advanced generative pre-trained transformer (GPT) language model available today, which uses a transformer architecture with a large number of parameters that allows it to learn and generate human-like text. This model exhibits greater capability in comprehending context, drawing generalisations from examples, and furnishing responses that are more precise and pertinent when contrasted with conventional conversational AI models.

The free version of ChatGPT is currently based on GPT-3.5, while the paid ChatGPT Plus is based on the GPT-4 platform, launched in March 2023. GPT-4 is multi-modal. It can handle text and image inputs. You can scan graphs, books of accounts or question papers and get answers from it.

OpenAI says GPT-4 can solve difficult problems with greater ac-

curacy thanks to its broader general knowledge and problem-solving abilities. It is apparently more intelligent, because it has scored higher in benchmark exams like the graduate record examinations (GRE) and the scholastic assessment test (SAT).

With respect to user experience, ChatGPT conversations are more engaging and interactive compared to traditional conversational AI models. Sahay feels that, “This is because ChatGPT has a clearer understanding of context, which allows it to maintain a more coherent conversation and respond specifically to user queries. As a result, users feel like they are talking to someone who is intelligent, knowledgeable, and empathetic, which makes the interaction more natural and human-like. On the other hand, when users talk to a bot built with traditional conversational AI models, they may not feel that the agent on the other end truly understands them or is empathetic. Overall, the combination of ChatGPT’s advanced technology and more natural user experience sets it apart from traditional conversational AI models.”

Sanjeev Azad, Vice President -

Technology, GlobalLogic, also feels that one of the key differentiators of ChatGPT is its adaptability—“The way it quickly adapts to the user’s communication style based on the questions asked, and personalises responses as per the user’s need.”

He further explains that the power and effectiveness of large language models can be evaluated in various ways, but the two most considered factors are the number of parameters and the extent of language coverage. GPT-3 has more than 175 billion parameters. Although the number of parameters of the multi-modal GPT-4 is not officially available as of the date this story is filed, it is rumoured to be more than a trillion.

ChatGPT can converse in any language as long as it has been trained on enough data in that language. According to a report by seo.ai, ChatGPT knew 95 natural languages, as of February 2023. It has also been trained on several programming languages, including Python, Java, C++, JavaScript, and Ruby.

OpenAI’s GPT is not without contenders in this respect. WuDao 2.0, a multi-modal AI developed by
