

out how far the computer screen is from me if I have a single camera, but with two cameras, I can use some algorithm to triangulate and find out how far the computer screen is. These are some of the areas where we see a lot of demand and growth happening.

Where are your manufacturing and designing facilities located?

All our R&D, design and development happens in our Chennai development centre. We have a couple of manufacturing partners. One of them is in Chennai and the other is in Gurugram. We also manufacture outside India for specific cases, but not always. Almost 95% or more manufacturing is done within India.

Many startups struggle for years, and most of them end up remaining just startups. How did you create the local ecosystem?

It has been a gradual process. We have been very focused and steadfast in how we must grow. We understood that we cannot create a company like this overnight. Our expectations were quite realistic, so we took our time in identifying and working with the right partners.

We joined hands with small partners who grew with us. We also included partners who were big for specific cases. It's been 20 years and we have gradually grown and learnt all that we need to do in-house on the manufacturing side, and with the EMS partner to maintain the quality. We have medical device companies that are buying from Switzerland and Germany, so we ship all units maintaining the same quality.

We have a very robust quality team in our company and in any EMS partner we work with. We make sure the quality is taken care of completely at all our facilities.

Above everything, we are not here to sell our products at a low

price. Our products are fighting on cost basis; we sell products that create value. We make sure we have enough margin to spend on quality and production so that this ecosystem is maintained well.

We are not into a commodity field to sell just any kind of camera in huge numbers. For example, we do not sell cameras for webcams or CCTV cameras. Our customers come to us for the superior technology of our cameras and their quality. This is the ecosystem we have built step by step.

What are the hiring trends in your company?

For the last few years, we have been trying to increase the bench strength. We always look for good people for R&D as well as in other areas like sales and production. Since we focus a lot on the R&D side, we are always looking for experienced engineers, as we are working with a very niche technology.

It's not easy to get experienced people in this field, so we hire a lot of freshers as well. We believe that, if we hire early, we can train them, so that they understand what we work on. So, we do a lot of hiring from colleges directly and then we make them go through rigorous training, where we explain what we have developed in-house, and get them up to date on cameras and imaging.

Which engineering areas do you recruit from?

Most of our recruits are from the electronics and communication background. We want people who have a strong electronics background because we are making hardware products. Even if they are working on the software side, with embedded software, a good understanding of electronics is helpful. Recently, we hired from computer science engineering backgrounds as

well. We train them in electronics basics which we require.

In case there is a recession in the global markets this year, as expected, how do you expect it to affect your company?

Our company is not focused on one customer or one market domain. We have customers in the industrial and retail sectors. Our revenue is almost equally split up among all sectors. There will be some ups and downs. There'll be some customers who'd buy more and some who'd buy less, but I believe that things will balance out eventually.

The other thing is that recession affects a lot of things which are not very necessary. There's a lot of need for many of the products that we are working on. It might slow down here and there, but things will go on.

We've been running this company for 20 years. We have seen the recession in 2008 and the Covid crisis. We saw how companies were unable to react at all; they didn't know whether to buy products. We had a complete shutdown of manufacturing. We managed that and we understand how things go on.

We are going to be very watchful, but we are not expecting any big changes. We are a very small company and are not likely to be majorly affected by recession. We are likely to have some business even if there is a recession.

What is your next milestone?

From financial perspective, we want to reach a revenue of \$100 million. We are working hard to get there at the earliest.

On the product side, we are making products for AMRs and autonomous shopping. We wish to be in a position where we are supplying these cameras to the top five or top ten customers or providers. **EFY**
