

curves even at light loads, all while meeting 'Class B' electromagnetic compatibility standards without the need for external components. The series finds typical applications across various industries, including providing housekeeping power in electric vehicle chargers, supporting industrial automation, serving in medical equipment, enabling IoT devices, contributing to lighting solutions, and enhancing smart energy systems.

Opto-emulator portfolio

Texas Instruments (TI) has launched an opto-emulator portfolio. Engineered to elevate signal integrity, minimise power consumption, and extend the lifespan of high-voltage industrial and automotive applications, these opto-emulators are set to revolutionise the industry. They are designed to operate across a wide temperature range from

-55°C to 125°C and exhibit exceptional common-

mode transient immunity, surpassing optocouplers by up to a factor of 10. Unlike traditional optocouplers that rely on LEDs for signal isolation and require overdesign to compensate for LED aging, these new opto-emulators eliminate this need by utilising SiO₂, mitigating the effects of LED aging and providing a stable, long-lasting solution. With the push for electrification and the complexities of designing high-voltage systems, engineers are increasingly seeking ways to improve

the performance and lifespan of their products while ensuring the right level of isolation.

Safety solution for autonomous driving

u-blox has launched the u-safe functional safety solution specifically tailored for vehicle positioning to move towards a more autonomous future. Leveraging components with a proven track record in driver navigation systems, this solution provides Tier 1 suppliers and original equipment manufacturers with a reliable advanced driver assistance systems

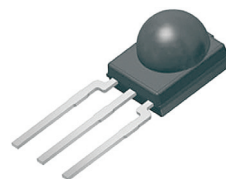

(ADAS) positioning tool, catering to ADAS Level 3 and beyond to ensure both functionality and safety, while enabling Level 2+ systems to prepare for higher automation levels. When integrated into ADAS and autonomous systems, u-safe is an added safety net, adhering to the ISO-26262 standard and providing reliable positioning solutions for the rapidly growing autonomous driving sector. While it is flexible enough to work with automotive-grade components, it can also be an independent solution for customers. It's especially suitable for ADAS L3 and higher autonomous driving applications. Customers also benefit from specialised integration support.

IR sensors with controlled sensitivity

New Yorker Electronics has launched two new fixed-gain infrared (IR) sensor modules from Vishay Intertechnology. The surface-mount TSSP93038DF1PZA and leaded TSSP93038SS1ZA are expected to provide robust operation in direct sunlight while providing enough sensitivity for light barrier applications. Designed in compact minimold packages with an irradiance of 1.3mW/m² and a rapid 260µs reaction time, they are suitable for long-range proximity sensing, with a range of 11m achiev-

able in light curtain applications through adjustments such as using a more focused

emitter or increasing the emitter forward current. They find versatile applications in toys, drones, robots, vicinity switches, traffic control lights, parking lots, gateway access, water level sensors, light barriers for sports racing, lawn-mower robots, hand dryers, towel or soap dispensers, water faucets, toilets, vending machine fall detection, security systems, pet gates, and offer protection against electromagnetic interference (EMI) with an IR filter to suppress visible light.
