LED bulb with dual lighting modes

Halonix Technologies has launched the 'UP-DOWN GLOW' LED bulb that features dual lighting—both the dome and the stem glow, but in distinct colours. The 10W LED bulb provides two distinct variants, with one featur-

ing white, warm, and mixed lighting effects, and the other offering white, blue, and mixed illuminations. Users can easily switch between a bright 10W light at the dome, a

soothing blue/warm white hue from the stem, and a composite mode that combines both, enhancing the room's ambiance uniquely. A standout feature of the bulb is its 360-degree illumination capability, ensuring consistent and even lighting that transforms room aesthetics. Its design allows for effortless installation in standard bulb holders, addressing recent market preferences for versatile lighting, including bright illumination for daily tasks, gentle light for entertainment, and ambiance-enhancing lighting for social gatherings, all within a single unit.

Interface between Reality AI and e² Studio

Renesas Electronics Corporation has launched interfaces between its Reality artificial intelligence (AI) tools

and the e² Studio integrated development environment. This empowers designers to exchange data, projects, and AI code modules between these essential programs. Users can easily

download and incorporate AI/ML classifiers generated within Reality AI tools directly from the e² Studio environment. These modules are purpose-built to streamline data collection from devices utilising MCUs, whether they are part of the company's kits or customer hardware. This integration significantly expedites the design process for AI and tiny machine learning (ML) applications, particularly at the edge and endpoint of IoT networks. The AI tools constitute a comprehensive software ecosystem for AI application development, allowing users to automatically explore sensor data and generate highly optimised models.

Smart access to replace physical keys

Southco has launched a wireless access system featuring a smart access application, the Keypanion app, that

lets users wirelessly actuate latches from their smartphones. The application's aim is to reduce dependency on physical keys that are difficult to keep track of and can be lost, stolen, or damaged. The app provides a history of the device's activity for up to fourteen days, enabling users to review access details and share or revoke access instantly. Additionally,

users can monitor the latch's status (open or closed) using a nearby device with the Keypanion app, and the status includes a timestamp indicating the last update. This combination of the Keypanion app, Southco Bluetooth controller, and compatible latch simplifies setup, requiring no dedicated IT team, and can be accessed easily through a smartphone, even without extensive technical knowledge.

A software for secure IoT connection to Azure IoT Hub

STMicroelectronics has launched software that streamlines the integration of Internet of Things (IoT) devices, developed with the advanced STM32H5 microcontrollers (MCUs), to the Microsoft Azure IoT Hub. With TLS encryption and securely stored Wi-Fi and Azure connection credentials, prebuilt

binaries ensure swift deployment and a secure connection. The demonstration application showcases secure connectivity from the device to Azure IoT Hub, handling network setup and data transmission, as well as managing Azure messages, methods, and twin update commands. Additionally, it offers robust processor architecture and heightened security, enabling developers to leverage Azure IoT Hub features through this new cube for converting device data into actionable insights, facilitating informed decisions, streamlined operations, and enhanced offerings. The Secure Manager safeguards IP on shared platforms, especially for AI inference, ensuring asset confidentiality and integrity in design, production, and deployment.
